## 16.220.1 Detailed Description

C++ [L4 Vcon](#) interface, see [Virtual Console](#) for the C interface.

[L4::Vcon](#) is a virtual console for simple character-based input and output. The interrupt for read events is provided by the virtual key interrupt.

The [Vcon](#) interface inherits from [L4::lcu](#) and [L4::Irq\\_eoi](#) for managing the virtual key interrupt which, in contrast to hardware IRQs, implements a limited functionality:

- Only IRQ line 0 is supported, no MSI vectors.
- The IRQ is edge-triggered and the IRQ mode cannot be changed.
- As the IRQ is edge-triggered, it does not have to be explicitly unmasked.

A server implementing the virtual console protocol has a queue for input events. When the first input event is added to the empty queue, the virtual key interrupt is triggered. Further events are added to the queue without generating further interrupts. The queue is emptied when a client reads all queued input events.

#### Include File

```
#include <l4/sys/vcon>
```

See the [Virtual Console](#) for the C interface.

Definition at line 45 of file [vcon](#).

## 16.220.2 Member Function Documentation

### 16.220.2.1 get\_attr()

```
l4_msgtag_t L4::Vcon::get_attr (  
    l4_vcon_attr_t * attr,  
    l4_utcb_t * utcb = l4_utcb()) const [inline], [noexcept]
```

Get attributes of this virtual console.

#### Parameters

---

out	<i>attr</i>	Attribute structure. Contains the attributes after a successful call of this function.
	<i>utcb</i>	UTCB to be used for this operation, shall be the UTCB of the calling thread. Defaults to <a href="#">l4_utcb</a> .

### Returns

Syscall return tag.

Definition at line 151 of file [vcon](#).

References [L4::Kobject::cap\(\)](#), and [l4\\_vcon\\_get\\_attr\\_u\(\)](#).

Here is the call graph for this function:

### 16.220.2.2 read()

```

int L4::Vcon::read (
    char * buf,
    unsigned size,
    l4_utcb_t * utcb = l4_utcb()) const [inline], [noexcept]

```

Read data from this virtual console.

### Parameters

out	<i>buf</i>	Pointer to data buffer.
	<i>size</i>	Size of the data buffer in bytes.
	<i>utcb</i>	UTCB to be used for this operation, shall be the UTCB of the calling thread. Defaults to <a href="#">l4_utcb</a> .

### Return values

<code>-L4_EPERM</code>	Insufficient permissions; see precondition.
<code>&gt;size</code>	More bytes to read, <code>size</code> bytes are in the buffer <code>buf</code> .
<code>&lt;=size</code>	Number of bytes read.

**Precondition**

The invoked [Vcon](#) capability must have the permission [L4\\_CAP\\_FPAGE\\_W](#).

**Note**

Size must not exceed [L4\\_VCON\\_READ\\_SIZE](#).

Definition at line 98 of file [vcon](#).

References [L4::Kobject::cap\(\)](#), and [l4\\_vcon\\_read\\_u\(\)](#).

Here is the call graph for this function:

**16.220.2.3 read\_with\_flags()**

```

int L4::Vcon::read_with_flags (
    char * buf,
    unsigned size,
    l4_utcb_t * utcb = l4_utcb()) const [inline], [noexcept]
  
```

Read data from [this](#) virtual console which also returns flags.

**Parameters**

out	<i>buf</i>	Pointer to data buffer.
	<i>size</i>	Size of the data buffer in bytes.
	<i>utcb</i>	UTCB to be used for this operation, shall be the UTCB of the calling thread. Defaults to <a href="#">l4_utcb</a> .

**Return values**

<a href="#">-L4_EPERM</a>	Insufficient permissions; see precondition.
<a href="#">&gt;size</a>	More bytes to read, <i>size</i> bytes are in the buffer <i>buf</i> .
<a href="#">&lt;=size</a>	Number of bytes read.

**Precondition**

The invoked [Vcon](#) capability must have the permission [L4\\_CAP\\_FPAGE\\_W](#).

If this function returns a positive value the caller can check the [L4\\_VCON\\_READ\\_STAT\\_BREAK](#) flag bit for a break condition. The bytes read can be obtained by masking the return value with [L4\\_VCON\\_READ\\_SIZE\\_MASK](#).

If a break condition is signaled, it is always the first event in the transmitted content, i.e. all characters supplied by this read call follow the break condition.

**Note**

Size must not exceed [L4\\_VCON\\_READ\\_SIZE](#).

Definition at line 125 of file [vcon](#).

References [L4::Kobject::cap\(\)](#).

Here is the call graph for this function:

**16.220.2.4 send()**

```

14_msgtag_t L4::Vcon::send (
    char const * buf,
    unsigned size,
    14_utcb_t * utcb = 14_utcb()) const [inline], [noexcept]
  
```

Send data to this virtual console.

**Parameters**

<i>buf</i>	Pointer to the data buffer.
<i>size</i>	Size of the data buffer in bytes.
<i>utcb</i>	UTCB to be used for this operation, shall be the UTCB of the calling thread. Defaults to <a href="#">l4_utcb</a> .

**Returns**

Syscall return tag

**Note**

Size must not exceed [L4\\_VCON\\_WRITE\\_SIZE](#), a proper value of the `size` parameter is NOT checked. Also, this function is a send only operation, this means there is no return value except for a failed send operation. Use [l4\\_ipc\\_error\(\)](#) to check for send errors, do not use [l4\\_error\(\)](#), as [l4\\_error\(\)](#) will always return an error.

Definition at line 65 of file [vcon](#).

References [L4::Kobject::cap\(\)](#), and [l4\\_vcon\\_send\\_u\(\)](#).

Here is the call graph for this function:

**16.220.2.5 set\_attr()**

```

l4_msgtag_t L4::Vcon::set_attr (
    l4_vcon_attr_t const * attr,
    l4_utcb_t * utcb = l4_utcb()) const [inline], [noexcept]
  
```

Set the attributes of this virtual console.

**Parameters**

<i>attr</i>	Attribute structure with the attributes for the virtual console.
<i>utcb</i>	UTCB to be used for this operation, shall be the UTCB of the calling thread. Defaults to <a href="#">l4_utcb</a> .

**Returns**

Syscall return tag.

Definition at line 138 of file [vcon](#).

References [L4::Kobject::cap\(\)](#), and [l4\\_vcon\\_set\\_attr\\_u\(\)](#).

Here is the call graph for this function:

### 16.220.2.6 write()

```
long L4::Vcon::write (
    char const * buf,
    unsigned size,
    l4_utcb_t * utcb = l4_utcb()) const [inline], [noexcept]
```

Write data to this virtual console.

#### Parameters

<i>buf</i>	Pointer to the data buffer.
<i>size</i>	Size of the data buffer in bytes.
<i>utcb</i>	UTCB to be used for this operation, shall be the UTCB of the calling thread. Defaults to <a href="#">l4_utcb</a> .

#### Return values

< 0	Error.
>= 0	Number of bytes written to the virtual console.

Definition at line 79 of file [vcon](#).

References [L4::Kobject::cap\(\)](#), and [l4\\_vcon\\_write\\_u\(\)](#).

Here is the call graph for this function:

## 16.221.1 Detailed Description

Virtual machine host address space.

[L4::Vm](#) is a specialisation of [L4::Task](#), used for virtual machines. The microkernel employs an appropriate page-table format for hosting VMs, such as ePT on VT-x. On Arm, it offers a call to make the virtual GICC area available to the VM.

Definition at line 17 of file [\\_\\_vm-arm.h](#).

## 16.221.2 Member Function Documentation

### 16.221.2.1 vgicc\_map()

```
l4_msgtag_t L4::Vm::vgicc_map (
    l4_fpage_t const vgicc_fpage,
    l4_utcb_t * utcb = l4_utcb()) [inline], [noexcept]
```

Map the GIC virtual CPU interface page to the task in case Fiasco detected a GIC version 2.

#### Parameters

<i>vgicc_fpage</i>	Flexpage that describes an area in the address space of the destination task to map the vGICC page to.
<i>utcb</i>	UTCB to be used for this operation, shall be the UTCB of the calling thread. See <a href="#">l4_utcb</a> .

#### Returns

Syscall return tag.

Definition at line 30 of file [\\_\\_vm-arm.h](#).

*raw value*

### 16.230.1 Detailed Description

Message tag data structure.

#### Include File

```
#include <l4/sys/types.h>
```

Describes the details of an IPC operation, in particular which parts of the UTCB have to be transmitted, and also flags to enable real-time and FPU extensions.

The message tag also contains a user-defined label that could be used to specify a protocol ID. Some negative values are reserved for kernel protocols such as page faults and exceptions.

The type must be treated completely opaque.

#### Examples

[examples/libs/l4re/c++/shared\\_ds/ds\\_srv.cc](#), [examples/libs/l4re/streammap/server.cc](#), [examples/sys/aliens/main.c](#), [examples/sys/ipc/ipc\\_example.c](#), [examples/sys/singlestep/main.c](#), [examples/sys/start-with-exc/main.c](#), and [examples/sys/utcb-ipc/main.c](#).

Definition at line 153 of file [types.h](#).

## 16.230.2 Member Function Documentation

### 16.230.2.1 flags()

```
unsigned l4_msgtag_t::flags () const [inline]
```

Get the flags value.

The flags are a combination of the flags defined by [L4\\_msgtag\\_flags](#).

Definition at line 178 of file [types.h](#).

References [L4\\_NOTHROW](#), and [raw](#).

### 16.230.2.2 has\_error()

```
bool l4_msgtag_t::has_error () const [inline]
```

Test if flags indicate an error.

If true, the error code is stored in the UTCB, see [l4\\_utcb\\_tcr\(\)->error](#).

Definition at line 191 of file [types.h](#).

References [L4\\_MSGTAG\\_ERROR](#), [L4\\_NOTHROW](#), and [raw](#).

Referenced by [L4Re::chkipc\(\)](#), [L4Re::chksys\(\)](#), [L4::Server< LOOP\\_HOOKS >::internal\\_loop\(\)](#), [L4::Server< LOOP\\_HOOKS >::reply](#) and [L4::throw\\_ipc\\_exception\(\)](#).

Here is the caller graph for this function:

The documentation for this struct was generated from the following file:

- [l4/sys/types.h](#)

## 16.231 l4\_sched\_cpu\_set\_t Struct Reference

CPU sets.

```
#include <scheduler.h>
```

Collaboration diagram for l4\_sched\_cpu\_set\_t:

l4_sched_cpu_set_t
+ gran_offset
+ map
+ granularity()
+ offset()
+ set()

### Public Member Functions

- unsigned char [granularity](#) () const
- unsigned [offset](#) () const
- void [set](#) (unsigned char [granularity](#), unsigned [offset](#))

*Set offset and granularity.*

### Data Fields

*Combination of granularity and offset.*
- [l4\\_umword\\_t](#) [map](#)  
*Bitmap of CPUs.*

### 16.231.1 Detailed Description

CPU sets.

#### Examples

[examples/sys/migrate/thread\\_migrate.cc](#).

Definition at line 58 of file [scheduler.h](#).

## 16.231.2 Member Function Documentation

### 16.231.2.1 granularity()

```
unsigned char l4_sched_cpu_set_t::granularity () const [inline]
```

#### Returns

Get granularity value

Definition at line 81 of file [scheduler.h](#).

References [gran\\_offset](#).

Referenced by [set\(\)](#).

Here is the caller graph for this function:

### 16.231.2.2 offset()

```
unsigned l4_sched_cpu_set_t::offset () const [inline]
```

#### Returns

Get offset value

Definition at line 83 of file [scheduler.h](#).

References [gran\\_offset](#).

Referenced by [set\(\)](#).

Here is the caller graph for this function:

### 16.231.2.3 set()

```
void l4_sched_cpu_set_t::set (  
    unsigned char granularity,  
    unsigned offset) [inline]
```

Set offset and granularity.

#### Parameters

---

<i>granularity</i>	Granularity in log2 notation.
<i>offset</i>	Offset. Must be a multiple of $2^{\text{granularity}}$ .

Definition at line 90 of file [scheduler.h](#).

References [gran\\_offset](#), [granularity\(\)](#), and [offset\(\)](#).

Here is the call graph for this function:

### 16.231.3 Field Documentation

#### 16.231.3.1 gran\_offset

`l4_umword_t l4_sched_cpu_set_t::gran_offset`

Combination of granularity and offset.

The granularity defines how many CPUs each bit in map describes. And the offset is the number of the first CPU described by the first bit in the bitmap.

#### Precondition

offset must be a multiple of  $2^{\text{granularity}}$ .

MSB	LSB
8bit granularity	24bit offset ..

Definition at line 72 of file [scheduler.h](#).

Referenced by [granularity\(\)](#), [L4::Scheduler::info\(\)](#), [l4\\_sched\\_cpu\\_set\(\)](#), [offset\(\)](#), and [set\(\)](#).

The documentation for this struct was generated from the following file:

- [l4/sys/scheduler.h](#)

## 16.232 l4\_sched\_param\_t Struct Reference

Scheduler parameter set.

```
#include <scheduler.h>
```

Collaboration diagram for l4\_sched\_param\_t:

### Data Fields

- [l4\\_sched\\_cpu\\_set\\_t affinity](#)  
*CPU affinity.*
- [l4\\_umword\\_t prio](#)  
*Priority for scheduling.*
- [l4\\_umword\\_t quantum](#)  
*Timeslice in micro seconds.*

### 16.232.1 Detailed Description

Scheduler parameter set.

#### Examples

[examples/sys/aliens/main.c](#), [examples/sys/migrate/thread\\_migrate.cc](#), [examples/sys/singlestep/main.c](#), [examples/sys/start-with-exc/main.c](#), and [examples/sys/utcb-ipc/main.c](#).

Definition at line 173 of file [scheduler.h](#).

## 16.232.2 Field Documentation

### 16.232.2.1 prio

`l4_umword_t l4_sched_param_t::prio`

Priority for scheduling.

The kernel supports priorities for userland threads in the range of 1..255. Priority 0 is reserved for the kernel.

Definition at line 182 of file [scheduler.h](#).

Referenced by [l4\\_sched\\_param\(\)](#).

The documentation for this struct was generated from the following file:

- [l4/sys/scheduler.h](#)

## 16.233 l4\_snd\_fpage\_t Struct Reference

Send-flexpage types.

```
#include <__l4_fpage.h>
```

Collaboration diagram for l4\_snd\_fpage\_t:

### Data Fields

- `l4_umword_t snd_base`  
*Offset in receive window (send base).*
- `l4_fpage_t fpage`  
*Source flexpage descriptor.*

### 16.233.1 Detailed Description

Send-flexpage types.

Definition at line 99 of file [\\_\\_l4\\_fpage.h](#).

The documentation for this struct was generated from the following file:

- [l4/sys/\\_\\_l4\\_fpage.h](#)

## 16.234 l4\_thread\_regs\_t Struct Reference

Encapsulation of the thread-control-register block of the UTCB.

```
#include <utcb.h>
```

Collaboration diagram for l4\_thread\_regs\_t:

### Data Fields

- [l4\\_umword\\_t](#) `error`  
*System call error code (see [l4\\_ipc\\_tcr\\_error\\_t](#)).*
- [l4\\_umword\\_t](#) `free_marker`  
*Kernel free marker.*
- [l4\\_umword\\_t](#) `user` [3]  
*User values (ignored and preserved by the kernel).*

### 16.234.1 Detailed Description

Encapsulation of the thread-control-register block of the UTCB.

Definition at line 99 of file [utcb.h](#).

## 16.234.2 Field Documentation

### 16.234.2.1 error

```
l4_umword_t l4_thread_regs_t::error
```

System call error code (see [l4\\_ipc\\_tcr\\_error\\_t](#)).

If the kernel indicates an error in the message tag (see [l4\\_msgtag\\_has\\_error\(\)](#) and [l4\\_msgtag\\_t::has\\_error\(\)](#)), the kernel writes the error code to this field.

Definition at line 106 of file [utcb.h](#).

### 16.234.2.2 free\_marker

```
l4_umword_t l4_thread_regs_t::free_marker
```

Kernel free marker.

The kernel sets this field to zero as soon as it is guaranteed that the kernel does not use the UTCB anymore for the bound thread. This usually happens while a thread is deleted. However, it is not defined when exactly the kernel sets the field. In particular, the point in time is not necessarily related to any IPC.

Userland may use this field for determining if a UTCB can be re-used for another thread. Note that, in order to make use of that feature, userland has to set this field to a non-zero value when a thread is bound with this UTCB.

Definition at line 120 of file [utcb.h](#).

The documentation for this struct was generated from the following file:

- [l4/sys/utcb.h](#)

## 16.235 l4\_timeout\_s Struct Reference

Basic timeout specification.

```
#include <__timeout.h>
```

Collaboration diagram for l4\_timeout\_s:

## Data Fields

- [l4\\_uint16\\_t](#)  
*timeout value*

### 16.235.1 Detailed Description

Basic timeout specification.

If bit 15 == 0, basically a floating point number with 10 bits mantissa and 5 bits exponent ( $t = m \cdot 2^e$ ).

If the mantissa is zero, the exponent encodes special values, see [L4\\_IPC\\_TIMEOUT\\_0](#) and [L4\\_IPC\\_TIMEOUT\\_NEVER](#).

If bit 15 == 1 the timeout is absolute and the lower 6 bits encode the index of the UTCB buffer register(s) holding the absolute 64-bit timeout value. On 32-bit systems, two consecutive UTCB buffer registers are used.

Definition at line 40 of file [\\_\\_timeout.h](#).

The documentation for this struct was generated from the following file:

- [l4/sys/\\_\\_timeout.h](#)

## 16.236 l4\_timeout\_t Union Reference

Timeout pair.

```
#include <__timeout.h>
```

Collaboration diagram for `l4_timeout_t`:

**Data Fields**

- [l4\\_uint32\\_t](#) **raw**  
*raw value*
- struct {  
    [l4\\_timeout\\_s](#) **rcv**  
        *receive timeout*  
    [l4\\_timeout\\_s](#) **snd**  
        *send timeout*  
} **p**  
  
*combined timeout*

**16.236.1 Detailed Description**

Timeout pair.

For IPC there are usually a send and a receive timeout. So this structure contains a pair of timeouts.

Definition at line 52 of file [\\_\\_timeout.h](#).

The documentation for this union was generated from the following file:

- [l4/sys/\\_\\_timeout.h](#)

**16.237 l4\_vcon\_attr\_t Struct Reference**

Vcon attribute structure.

```
#include <vcon.h>
```

Collaboration diagram for l4\_vcon\_attr\_t:

l4_vcon_attr_t
+ i_flags
+ o_flags
+ l_flags
+ set_raw()

**Public Member Functions**

- void [set\\_raw](#) ()  
*Set terminal attributes to disable all special processing.*

## Data Fields

- [l4\\_umword\\_t i\\_flags](#)  
*input flags*
- [l4\\_umword\\_t o\\_flags](#)  
*output flags*
- [l4\\_umword\\_t l\\_flags](#)  
*local flags*

### 16.237.1 Detailed Description

Vcon attribute structure.

The flags members can be a combination of their respective enums.

VMX vCPU state.

```
#include <\_\_vm-vmx.h>
```

Collaboration diagram for `l4_vm_vmx_vcpu_state_t`:

### 16.248.1 Detailed Description

VMX vCPU state.

This is a specialization of the generic vCPU state for VMX. This data structure represents the following memory layout:

- 0x000 - 0x1ff: Standard vCPU state (with padding). See [l4\\_vcpu\\_state\\_t](#).
- 0x200 - 0x3ff: VMX information members (with padding). See [l4\\_vm\\_vmx\\_vcpu\\_infos\\_t](#).
- 0x400 - 0xffff: VMX software VMCS. See [l4\\_vm\\_vmx\\_vcpu\\_vmcs\\_t](#).

**Note**

The memory layout is documented here for reference purposes. However, the users are strongly discouraged from accessing the data structure directly. The API functions defined in this file are the preferred way of achieving the functionality.

Definition at line 267 of file [\\_\\_vm-vmx.h](#).

The documentation for this struct was generated from the following file:

- l4/sys/\_\_vm-vmx.h

## 16.249 l4\_vm\_vmx\_vcpu\_vmcs\_t Struct Reference

VMX software VMCS.

```
#include <__vm-vmx.h>
```

Collaboration diagram for l4\_vm\_vmx\_vcpu\_vmcs\_t:

### 16.249.1 Detailed Description

VMX software VMCS.

This data structure represents the following memory layout:

- 0x000 - 0x007: Reserved (ignored by the kernel). In the hardware VMCS, the revision identifier and the abort indicator are stored in this area. Hereby we simply ignore these two entries.
- 0x008 - 0x00f: User space data (ignored by the kernel). This currently stores the pointer to a different software VMCS whose content has been loaded to this software VMCS.

- 0x010 - 0x013: VMCS field index of the software-defined CR2 field in the software VMCS.
- 0x014 - 0x017: Reserved.
- 0x018 - 0x01f: Capability of the vCPU context, i.e. the hardware VMCS object (with padding).
- 0x020 - 0x047: Software VMCS field offset table. See [l4\\_vmx\\_offset\\_table\\_t](#).
- 0x048 - 0x0bf: Reserved.
- 0x0c0 - 0xabf: Software VMCS fields (with padding).
- 0xac0 - 0xbff: Software VMCS fields dirty bitmap (with padding).

#### Note

The memory layout is documented here for reference purposes. However, the users are strongly discouraged from accessing the data structure directly. The API functions defined in this file are the preferred way of achieving the functionality.

Definition at line 205 of file [\\_\\_vm-vmx.h](#).

The documentation for this struct was generated from the following file:

- l4/sys/\_\_vm-vmx.h

## 16.250 l4\_vmx\_offset\_table\_t Struct Reference

Software VMCS field offset table.

```
#include <__vm-vmx.h>
```

Collaboration diagram for l4\_vmx\_offset\_table\_t:

### 16.250.1 Detailed Description

Software VMCS field offset table.

This data structure represents the following memory layout:

- 0x00 - 0x02: 3 offsets for 16-bit fields.
- 0x03: Reserved.
- 0x04 - 0x06: 3 offsets for 64-bit fields.
- 0x07: Reserved.
- 0x08 - 0x0a: 3 offsets for 32-bit fields.
- 0x0b: Reserved.
- 0x0c - 0x0e: 3 offsets for natural-width fields.
- 0x0f: Reserved.
- 0x10 - 0x12: 3 limits for 16-bit fields.
- 0x13: Reserved.
- 0x14 - 0x16: 3 limits for 64-bit fields.
- 0x17: Reserved.
- 0x18 - 0x1a: 3 limits for 32-bit fields.
- 0x1b: Reserved.
- 0x1c - 0x1e: 3 limits for natural-width fields.
- 0x1f: Reserved.
- 0x20 - 0x23: 4 index shifts.
- 0x24: Offset of the first software VMCS field.
- 0x25: Size of the software VMCS fields.
- 0x26 - 0x27: Reserved.

The offsets/limits in each size category are in the following order:

- Control fields.
- Read-only fields.
- Guest fields.

The index shifts are in the following order:

- 16-bit.
- 64-bit.
- 32-bit.
- Natural-width.

All offsets/limits/sizes are represented in a 64-byte granule.

The offsets (after being multiplied by 64) are indexes in the values array in [l4\\_vm\\_vmx\\_vcpu\\_vmcs\\_t](#) and bit indexes in the dirty\_bitmap array in [l4\\_vm\\_vmx\\_vcpu\\_vmcs\\_t](#).

The limits (after being multiplied by 64) represent the range of the available indexes.

## Note

The memory layout is documented here for reference purposes. However, the users are strongly discouraged from accessing the data structure directly. The API functions defined in this file are the preferred way of achieving the functionality.

Definition at line 155 of file [\\_\\_vm-vmx.h](#).

The documentation for this struct was generated from the following file:

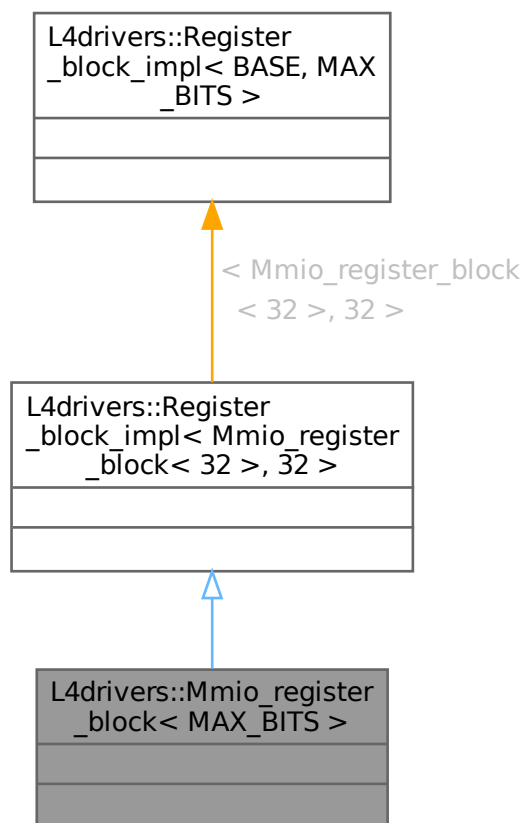

- [l4/sys/\\_\\_vm-vmx.h](#)

## 16.251 L4drivers::Mmio\_register\_block< MAX\_BITS > Struct Template Reference

An MMIO block with up to 64-bit register access (32-bit default) and little endian byte order.

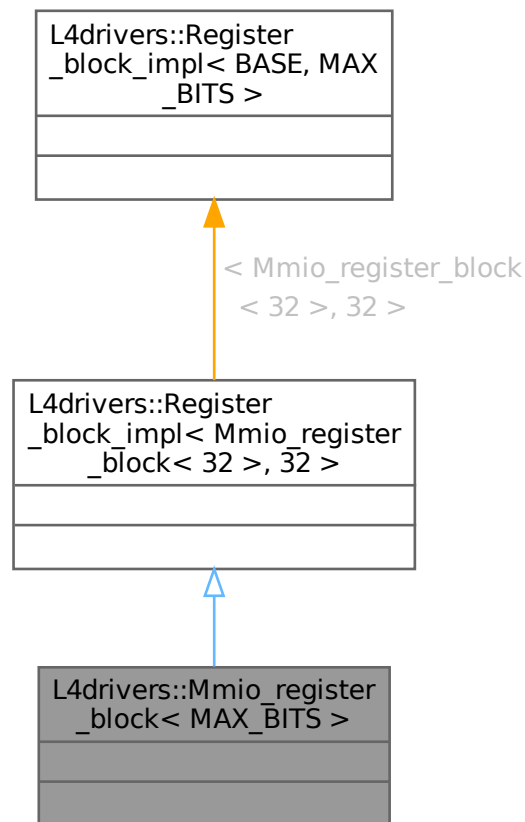

```
#include <hw_mmio_register_block>
```

Inheritance diagram for L4drivers::Mmio\_register\_block< MAX\_BITS >:

Collaboration diagram for L4drivers::Mmio\_register\_block< MAX\_BITS >:

### 16.251.1 Detailed Description

```
template<unsigned MAX_BITS = 32>
struct L4drivers::Mmio_register_block< MAX_BITS >
```

An MMIO block with up to 64-bit register access (32-bit default) and little endian byte order.

Definition at line 43 of file [hw\\_mmio\\_register\\_block](#).

The documentation for this struct was generated from the following file:

- pkg/drivers-frst/include/hw\_mmio\_register\_block

## 16.252 L4drivers::Register\_block< MAX\_BITS, BLOCK > Class Template Reference

Handles a reference to a register block of the given maximum access width.

```
#include <hw_register_block>
```

Collaboration diagram for L4drivers::Register\_block< MAX\_BITS, BLOCK >:

L4drivers::Register_block< MAX_BITS, BLOCK >	
+	r()
+	operator[]()
+	r()
+	operator[]()

### Public Member Functions

- template<unsigned BITS>  
[Ro\\_register\\_tmpl](#)< BITS, Block > [r](#) (unsigned offset) const  
*Read only access to register at offset offset.*
- [Ro\\_register\\_operator](#)[] (unsigned offset) const  
*Read only access to register at offset offset.*
- template<unsigned BITS>  
[Register\\_tmpl](#)< BITS, Block > [r](#) (unsigned offset)  
*Read/write access to register at offset offset.*
- [Register\\_operator](#)[] (unsigned offset)  
*Read/write access to register at offset offset.*

### 16.252.1 Detailed Description

```
template<unsigned MAX_BITS, typename BLOCK = Register_block_tmpl< Register_block_base<MAX_BITS> >>
class L4drivers::Register_block< MAX_BITS, BLOCK >
```

Handles a reference to a register block of the given maximum access width.

Register block.

### Template Parameters

<i>MAX_BITS</i>	Maximum access width for the registers in this block.
<i>BLOCK</i>	Type implementing the register accesses ( <code>read&lt;&gt;()</code> , <code>write&lt;&gt;()</code> , <code>modify&lt;&gt;()</code> , <code>set&lt;&gt;()</code> , and <code>clear&lt;&gt;()</code> ).

Provides access to registers in this block via `r<WIDTH>()` and `operator[]()`.

Example usage:

```
void test()
{
    // create a register block reference for max. 16bit accesses, using a
    // MMIO register block implementation (at address 0x1000).
    Hw::Register_block<16> regs = new Hw::Mmio_register_block<16>(0x1000);

    // Alternatively it is allowed to use an implementation that allows
    // wider access than actually needed.
    Hw::Register_block<16> regs = new Hw::Mmio_register_block<32>(0x1000);

    // read a 16bit register at offset 8byte
    unsigned short x = regs.r<16>(8);
    unsigned short x1 = regs[8]; // alternative

    // read an 8bit register at offset 0byte
    unsigned v = regs.r<8>(0);

    // do a 16bit write to register at offset 2byte (four variants)
    regs[2] = 22;
    regs.r<16>(2) = 22;
    regs[2].write(22);
    regs.r<16>().write(22);

    // do an 8bit write (two variants)
    regs.r<8>(0) = 9;
    regs.r<8>(0).write(9);

    // do 16bit read-modify-write (two variants)
    regs[4].modify(0xf, 3); // clear 4 lowest bits and set them to 3
    regs.r<16>(4).modify(0xf, 3);

    // do 8bit read-modify-write
    regs.r<8>(0).modify(0xf, 3);

    // fails to compile, because of too wide access
    // (32 bit access but regs is Hw::Register_block<16>)
    unsigned long v = regs.r<32>(4);
}
```

Definition at line 330 of file `hw_register_block`.

## 16.252.2 Member Function Documentation

### 16.252.2.1 `operator[]()` [1/2]

```
template<unsigned MAX_BITS, typename BLOCK = Register_block_tmpl< Register_block_base<MAX_BITS> >>
Register L4drivers::Register_block< MAX_BITS, BLOCK >::operator[] (
    unsigned offset) [inline]
```

Read/write access to register at offset *offset*.

#### Parameters

<i>offset</i>	The offset of the register within the register file.
---------------	--

**Returns**

register object allowing read and write access with width *MAX\_BITS*.

Definition at line 385 of file [hw\\_register\\_block](#).

References [r\(\)](#).

Here is the call graph for this function:

**16.252.2.2 operator[]() [2/2]**

template<unsigned BITS>
Register_tmpl< BITS, Block > L4drivers::Register_block< MAX_BITS, BLOCK >::r (
    unsigned offset) [inline]
```

Read/write access to register at offset *offset*.

**Template Parameters**

<i>BITS</i>	the access width in bits for the register.
-------------	--

**Parameters**

<i>offset</i>	The offset of the register within the register file.
---------------	--

**Returns**

register object allowing read and write access with width *BITS*.

Definition at line 376 of file [hw\\_register\\_block](#).

**16.252.2.4** `r()` [2/2]

```
template<unsigned MAX_BITS, typename BLOCK = Register_block_tmpl< Register_block_base<MAX_BITS> >>
template<unsigned BITS>
Ro_register_tmpl< BITS, Block > L4drivers::Register_block< MAX_BITS, BLOCK >::r (
    unsigned offset) const [inline]
```

Read only access to register at offset *offset*.

**Template Parameters**

<i>BITS</i>	the access width in bits for the register.
-------------	--

**Parameters**

<i>offset</i>	The offset of the register within the register file.
---------------	--

**Returns**

register object allowing read only access with width *BITS*.

Definition at line 357 of file [hw\\_register\\_block](#).

Referenced by [operator\[\]\(\)](#), and [operator\[\]\(\)](#).

## 16.253 L4drivers::Register\_block\_base< MAX\_BITS > Struct Template Reference

Abstract register block interface.

Inheritance diagram for L4drivers::Register\_block\_base< MAX\_BITS >:

Collaboration diagram for L4drivers::Register\_block\_base< MAX\_BITS >:

### 16.253.1 Detailed Description

```
template<unsigned MAX_BITS = 32>
struct L4drivers::Register_block_base< MAX_BITS >
```

Abstract register block interface.

#### Template Parameters

<i>MAX_BITS</i>	The maximum access width for the registers.
-----------------	---

This interfaces is based on virtual `do_read_<xx>` and `do_write_<xx>` methods that have to be implemented up to the maximum access width.

Definition at line 72 of file [hw\\_register\\_block](#).

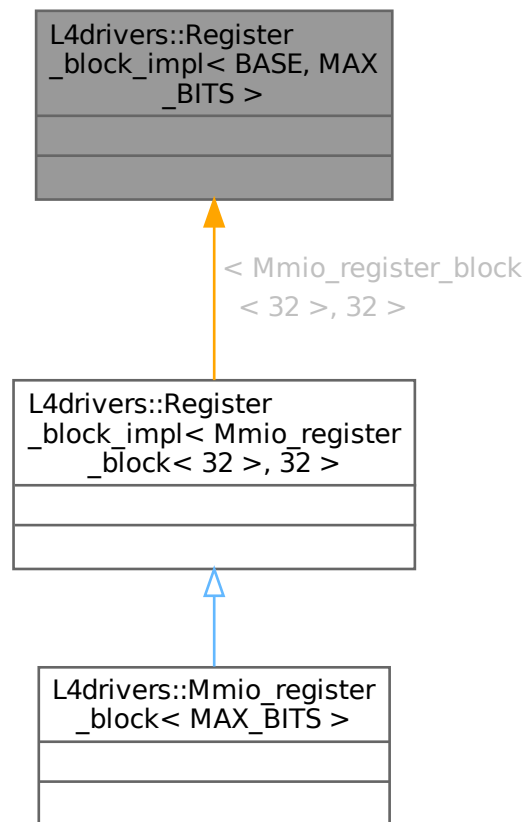

The documentation for this struct was generated from the following file:

- `pkg/drivers-frst/include/hw_register_block`

## 16.254 L4drivers::Register\_block\_impl< BASE, MAX\_BITS > Struct Template Reference

Implementation helper for register blocks.

Inheritance diagram for L4drivers::Register\_block\_impl< BASE, MAX\_BITS >:

Collaboration diagram for L4drivers::Register\_block\_impl< BASE, MAX\_BITS >:

### 16.254.1 Detailed Description

```
template<typename BASE, unsigned MAX_BITS = 32>
struct L4drivers::Register_block_tmpl< BASE, MAX_BITS >
```

Implementation helper for register blocks.

#### Parameters

<i>BASE</i>	The class implementing read<> and write<> template functions for accessing the registers. This class must inherit from <a href="#">Register_block_impl</a> .
<i>MAX_BITS</i>	The maximum access width for the register file. Supported values are 8, 16, 32, or 64.

This template allows easy implementation of register files by providing read<> and write<> template functions, see [Mmio\\_register\\_block](#) as an example.

Definition at line 455 of file [hw\\_register\\_block](#).

The documentation for this struct was generated from the following file:

- [pkg/drivers-frst/include/hw\\_register\\_block](#)

## 16.255 L4drivers::Register\_block\_tmpl< BLOCK > Class Template Reference

Helper template that translates to the [Register\\_block\\_base](#) interface.

```
#include <hw_register_block>
```

Inheritance diagram for L4drivers::Register\_block\_tmpl< BLOCK >:

Collaboration diagram for L4drivers::Register\_block\_tmpl< BLOCK >:

### 16.255.1 Detailed Description

```
template<typename BLOCK>
class L4drivers::Register_block_tmpl< BLOCK >
```

Helper template that translates to the [Register\\_block\\_base](#) interface.

#### Template Parameters

<i>BLOCK</i>	The type of the <a href="#">Register_block_base</a> interface to use.
--------------	---

This helper translates `read<T>()`, `write<T>()`, `set<T>()`, `clear<T>()`, and `modify<T>()` calls to `BLOCK::do_↔read_<xx>` and `BLOCK::do_write_<xx>`.

Definition at line 156 of file [hw\\_register\\_block](#).

The documentation for this class was generated from the following file:

- `pkg/drivers-frst/include/hw_register_block`

## 16.256 L4drivers::Register\_tmpl< BITS, BLOCK > Class Template Reference

Single hardware register inside a [Register\\_block\\_base](#) interface.

```
#include <hw_register_block>
```

Inheritance diagram for L4drivers::Register\_tmpl< BITS, BLOCK >:

Collaboration diagram for L4drivers::Register\_tmpl< BITS, BLOCK >:

### 16.256.1 Detailed Description

```
template<unsigned BITS, typename BLOCK>
class L4drivers::Register_tmpl< BITS, BLOCK >
```

Single hardware register inside a [Register\\_block\\_base](#) interface.

#### Template Parameters

---

<i>BITS</i>	The access width for the register in bits.
<i>BLOCK</i>	the type of the <a href="#">Register_block_base</a> interface.

#### Note

Objects of this type must be used only in temporary contexts not in global, class, or object scope.

Definition at line 237 of file [hw\\_register\\_block](#).

## 16.256.2 Member Function Documentation

### 16.256.2.1 clear()

```
template<unsigned BITS, typename BLOCK>
value_type L4drivers::Register_tmpl< BITS, BLOCK >::clear (
    value_type clear_bits) [inline]
```

clears bits in *clear\_bits* in the hardware register.

#### Parameters

<i>clear_bits</i>	bits to be cleared within the hardware register.
-------------------	--

This is a read-modify-write function that does a logical and of the old value from the register with the negated value of *clear\_bits*.

```
unsigned old_value = read();
write(old_value & ~clear_bits);
```

Definition at line 290 of file [hw\\_register\\_block](#).

Referenced by [L4drivers::Register\\_tmpl< MAX\\_BITS, Block >::clear\(\)](#).

Here is the caller graph for this function:

### 16.256.2.2 modify()

```
template<unsigned BITS, typename BLOCK>
value_type L4drivers::Register_tmpl< BITS, BLOCK >::modify (
    value_type clear_bits,
    value_type set_bits) [inline]
```

clears bits in *clear\_bits* and sets bits in *set\_bits* in the hardware register.

#### Parameters

<i>clear_bits</i>	bits to be cleared within the hardware register.
<i>set_bits</i>	bits to set in the hardware register.

This is a read-modify-write function that first does a logical and of the old value from the register with the negated value of *clear\_bits* and then does a logical or with *set\_bits*.

```
unsigned old_value = read();
write((old_value & ~clear_bits) | set_bits);
```

Definition at line 308 of file [hw\\_register\\_block](#).

Referenced by [L4drivers::Register\\_tmpl< MAX\\_BITS, Block >::modify\(\)](#).

Here is the caller graph for this function:

### 16.256.2.3 operator=()

```
template<unsigned BITS, typename BLOCK>
Register_tmpl & L4drivers::Register_tmpl< BITS, BLOCK >::operator= (
    value_type val) [inline]
```

write *val* into the hardware register.

#### Parameters

<i>val</i>	the value to write into the hardware register.
------------	--

Definition at line 252 of file [hw\\_register\\_block](#).

### 16.256.2.4 set()

```
template<unsigned BITS, typename BLOCK>
value_type L4drivers::Register_tmpl< BITS, BLOCK >::set (
    value_type set_bits) [inline]
```

set bits in *set\_bits* in the hardware register.

#### Parameters

<i>set_bits</i>	bits to be set within the hardware register.
-----------------	--

This is a read-modify-write function that does a logical or of the old value from the register with *set\_bits*.

```
unsigned old_value = read();
write(old_value | set_bits);
```

Definition at line 274 of file [hw\\_register\\_block](#).

Referenced by [L4drivers::Register\\_tmpl< MAX\\_BITS, Block >::set\(\)](#).

Here is the caller graph for this function:

### 16.256.2.5 write()

```
template<unsigned BITS, typename BLOCK>
void L4drivers::Register_tmpl< BITS, BLOCK >::write (
    value_type val) [inline]
```

write *val* into the hardware register.

#### Parameters

<i>val</i>	the value to write into the hardware register.
------------	--

Definition at line 259 of file [hw\\_register\\_block](#).

Referenced by [L4drivers::Register\\_tmpl< MAX\\_BITS, Block >::operator=\(\)](#), and [L4drivers::Register\\_tmpl< MAX\\_BITS, Block >::write](#).

Here is the caller graph for this function:

The documentation for this class was generated from the following file:

```
template<unsigned MAX_BITS, typename BLOCK = Register_block_tmpl< Register_block_base<MAX_BITS>
BITS> const >>
class L4drivers::Ro_register_block< MAX_BITS, BLOCK >
```

Handles a reference to a read only register block of the given maximum access width.

### Template Parameters

<i>MAX_BITS</i>	Maximum access width for the registers in this block.
<i>BLOCK</i>	Type implementing the register accesses (read<>()),

Provides read only access to registers in this block via [r<WIDTH>\(\)](#) and [operator\[\]\(\)](#).

Definition at line 404 of file [hw\\_register\\_block](#).

## 16.257.2 Member Function Documentation

### 16.257.2.1 operator[]()

```
template<unsigned MAX_BITS, typename BLOCK = Register_block_tmpl< Register_block_base<MAX_↵
BITS> const >>
Ro_register L4drivers::Ro_register_block< MAX_BITS, BLOCK >::operator[] (
    unsigned offset) const [inline]
```

Read only access to register at offset *offset*.

#### Parameters

<i>offset</i>	The offset of the register within the register file.
---------------	--

#### Returns

register object allowing read only access with width *MAX\_BITS*.

Definition at line 426 of file [hw\\_register\\_block](#).

### 16.257.2.2 r()

```
template<unsigned MAX_BITS, typename BLOCK = Register_block_tmpl< Register_block_base<MAX_↵
BITS> const >>
template<unsigned BITS>
Ro_register_tmpl< BITS, Block > L4drivers::Ro_register_block< MAX_BITS, BLOCK >::r (
    unsigned offset) const [inline]
```

Read only access to register at offset *offset*.

#### Template Parameters

<i>BITS</i>	the access width in bits for the register.
-------------	--

#### Parameters

<i>offset</i>	The offset of the register within the register file.
---------------	--

#### Returns

register object allowing read only access with width *BITS*.

Definition at line 436 of file [hw\\_register\\_block](#).

The documentation for this class was generated from the following file:

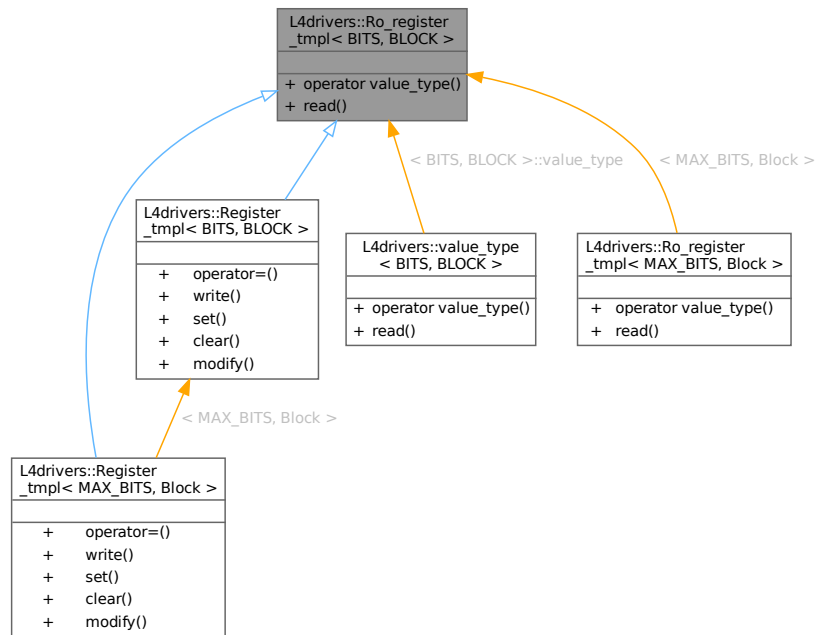

- pkg/drivers-frst/include/hw\_register\_block

## 16.258 L4drivers::Ro\_register\_tmpl< BITS, BLOCK > Class Template Reference

Single read only register inside a [Register\\_block\\_base](#) interface.

- `value_type read()` const  
read the value from the hardware register.

### 16.258.1 Detailed Description

```
template<unsigned BITS, typename BLOCK>
class L4drivers::Ro_register_tmpl< BITS, BLOCK >
```

Single read only register inside a [Register\\_block\\_base](#) interface.

#### Template Parameters

<i>BITS</i>	The access with of the register in bits.
<i>BLOCK</i>	The type for the <a href="#">Register_block_base</a> interface.

#### Note

Objects of this type must be used only in temporary contexts not in global, class, or object scope.

Allows simple read only access to a hardware register.

Definition at line 201 of file [hw\\_register\\_block](#).

### 16.258.2 Member Function Documentation

#### 16.258.2.1 operator value\_type()

```
template<unsigned BITS, typename BLOCK>
L4drivers::Ro_register_tmpl< BITS, BLOCK >::operator value_type () const [inline]
```

read the value from the hardware register.

#### Returns

value read from the hardware register.

Definition at line 217 of file [hw\\_register\\_block](#).

#### 16.258.2.2 read()

```
template<unsigned BITS, typename BLOCK>
value_type L4drivers::Ro_register_tmpl< BITS, BLOCK >::read () const [inline]
```

read the value from the hardware register.

**Returns**

value from the hardware register.

Definition at line 224 of file [hw\\_register\\_block](#).

Referenced by [L4drivers::value\\_type< BITS, BLOCK >::operator value\\_type\(\)](#), and [L4drivers::value\\_type< BITS, BLOCK >::read\(\)](#).

*Release the shared pointer without removing the reference.*

## 16.261.1 Detailed Description

```
template<typename T = void, template< typename X > class CNT = Default_ref_counter>
class L4Re::Core::Ref_ptr< T, CNT >
```

A reference-counting pointer with automatic cleanup.

### Template Parameters

<i>T</i>	Type of object the pointer points to.
<i>CNT</i>	Type of management class that manages the life time of the object.

This pointer is similar to the standard C++-11 `shared_ptr` but it does the reference counting directly in the object being pointed to, so that no additional management structures need to be allocated from the heap.

Classes that use this pointer type must implement two functions:

```
int remove_ref()
```

is called when a reference is removed and must return 0 when there are no further references to the object.

```
void add_ref()
```

is called when another `ref_ptr` to the object is created.

`Ref_obj` provides a simple implementation of this interface from which classes may inherit.

Definition at line 70 of file [ref\\_ptr](#).

## 16.261.2 Constructor & Destructor Documentation

### 16.261.2.1 Ref\_ptr() [1/3]

```
template<typename T = void, template< typename X > class CNT = Default_ref_counter>
cxx::Ref_ptr< T, CNT >::Ref_ptr (
    Wp const & o) [inline], [noexcept]
```

Create a shared pointer from a weak pointer.

Increases references.

Definition at line 88 of file [ref\\_ptr](#).

### 16.261.2.2 Ref\_ptr() [2/3]

```
template<typename T = void, template< typename X > class CNT = Default_ref_counter>
template<typename X>
cxx::Ref_ptr< T, CNT >::Ref_ptr (
    X * o) [inline], [explicit], [noexcept]
```

Create a shared pointer from a raw pointer.

In contrast to C++11 `shared_ptr` it is safe to use this constructor multiple times and have the same reference counter.

Definition at line 101 of file [ref\\_ptr](#).

### 16.261.2.3 Ref\_ptr() [3/3]

```
template<typename T = void, template< typename X > class CNT = Default_ref_counter>
cxx::Ref_ptr< T, CNT >::Ref_ptr (
    T * o,
    bool d) [inline], [noexcept]
```

Create a shared pointer from a raw pointer without creating a new reference.

#### Parameters

<i>o</i>	Pointer to the object.
<i>d</i>	Dummy parameter to select this constructor at compile time. The value may be true or false.

This is the counterpart to [release\(\)](#).

Definition at line [114](#) of file [ref\\_ptr](#).

## 16.261.3 Member Function Documentation

### 16.261.3.1 `get()`

```
template<typename T = void, template< typename X > class CNT = Default_ref_counter>
T * cxx::Ref\_ptr< T, CNT >::get () const [inline], [noexcept]
```

Return a raw pointer to the object this shared pointer points to.

This does not release the pointer or decrease the reference count.

Definition at line [121](#) of file [ref\\_ptr](#).

### 16.261.3.2 `ptr()`

```
template<typename T = void, template< typename X > class CNT = Default_ref_counter>
T * cxx::Ref\_ptr< T, CNT >::ptr () const [inline], [noexcept]
```

Return a raw pointer to the object this shared pointer points to.

This does not release the pointer or decrease the reference count.

Definition at line [127](#) of file [ref\\_ptr](#).

### 16.261.3.3 `release()`

```
template<typename T = void, template< typename X > class CNT = Default_ref_counter>
T * cxx::Ref\_ptr< T, CNT >::release () [inline], [noexcept]
```

Release the shared pointer without removing the reference.

#### Returns

A raw pointer to the managed object.

Definition at line [138](#) of file [ref\\_ptr](#).

The documentation for this class was generated from the following file:

- [I4/cxx/ref\\_ptr](#)

### 16.262.1 Detailed Description

Interface for memory-like objects.

Dataspaces are a central abstraction provided by [L4Re](#). A dataspace is an abstraction for any thing that is available via usual memory access instructions. A dataspace can be a file, as well as the memory-mapped registers of a device, or anonymous memory, such as a heap.

The dataspace interface defines a set of methods that allow any kind of dataspace to be attached (mapped) to the virtual address space of an [L4](#) task and then be accessed via memory-access instructions. The [L4Re::Rm](#) interface can be used to attach a dataspace to a virtual address space of a task paged by a certain instance of a region map.

#### Include File

```
#include <l4/re/dataspace>
```

#### Examples

[examples/libs/l4re/c++/mem\\_alloc/ma+rm.cc](#), [examples/libs/l4re/c++/shared\\_ds/ds\\_clnt.cc](#), and [examples/libs/l4re/c++/shared](#)

Definition at line 50 of file [dataspace](#).

### 16.262.2 Member Function Documentation

#### 16.262.2.1 allocate()

```
long L4Re::Dataspace::allocate (
    Offset offset,
    Size size)
```

Allocate a range in the dataspace.

#### Parameters

<i>offset</i>	Offset in the dataspace, in bytes.
<i>size</i>	Size of the range, in bytes.

#### Return values

<i>L4_EOK</i>	Success
---------------	---------

<code>-L4_ERANGE</code>	Given range is outside the dataspace. (A dataspace provider may also silently ignore areas outside the dataspace.)
<code>-L4_ENOMEM</code>	Not enough memory available.
<code>&lt; 0</code>	IPC errors

On success, at least the given range is guaranteed to be allocated. The dataspace manager may also allocate more memory due to page granularity.

The memory is allocated with the same rights as the dataspace capability.

References [allocate\(\)](#), [copy\\_in\(\)](#), and [size\(\)](#).

Referenced by [allocate\(\)](#).

Here is the call graph for this function:

Here is the caller graph for this function:

### 16.262.2.2 clear()

```

long L4Re::Dataspace::clear (
    Offset offset,
    Size size)

```

Clear parts of a dataspace.

#### Parameters

<i>offset</i>	Offset within dataspace (in bytes).
<i>size</i>	Size of region to clear (in bytes).

#### Return values

$\geq 0$	Success.
<code>-L4_ERANGE</code>	Given range is outside the dataspace. (A dataspace provider may also silently ignore areas outside the dataspace.)
<code>-L4_EACCESS</code>	No <code>L4_CAP_FPAGE_W</code> right on dataspace capability.
$< 0$	IPC errors

Zeros out the memory. Depending on the type of memory the memory could also be deallocated and replaced by a shared zero-page.

References [clear\(\)](#), and [size\(\)](#).

Referenced by [clear\(\)](#).

Here is the call graph for this function:

Here is the caller graph for this function:

### 16.262.2.3 copy\_in()

```

long L4Re::Dataspace::copy_in (
    Offset dst_offs,
    L4::Ipc::Cap< Dataspace > src,
    Offset src_offs,
    Size size)

```

Copy contents from another dataspace.

#### Parameters

<code>dst_offs</code>	Offset in destination dataspace.
-----------------------	----------------------------------

<i>src</i>	Source dataspace to copy from.
<i>src_offs</i>	Offset in the source dataspace.
<i>size</i>	Size to copy (in bytes).

**Return values**

<i>L4_EOK</i>	Success
<i>-L4_EACCESS</i>	No <a href="#">L4_CAP_FPAGE_W</a> right on the destination dataspace.
<i>-L4_EINVAL</i>	Invalid parameter supplied.
<i>&lt; 0</i>	IPC errors

The copy operation may use copy-on-write mechanisms. The operation may also fail if both dataspace managers are not from the same dataspace manager or the dataspace managers do not cooperate.

References [flags\(\)](#), and [size\(\)](#).

Referenced by [allocate\(\)](#).

Here is the call graph for this function:

Here is the caller graph for this function:

**16.262.2.4 flags()**

```
Dataspace::Flags Dataspace::flags () const [noexcept]
```

Get flags of the dataspace.

**Return values**

$\geq 0$	Flags of the dataspace
$< 0$	IPC errors

See also

[L4Re::Dataspace::F::Flags](#)

Definition at line 111 of file [dataspace\\_impl.h](#).

Here is the call graph for this function:

Here is the caller graph for this function:

### 16.262.2.5 info()

```
long L4Re::Dataspace::info (
    Stats * stats)
```

Get information on the dataspace.

#### Parameters

out	stats	<a href="#">Dataspace</a> information
-----	-------	---------------------------------------

#### Return values

0	Success
<0	IPC errors

References [flags\(\)](#), [info\(\)](#), [L4\\_RPC](#), [L4\\_RPC\\_NF](#), [map\(\)](#), and [map\\_info\(\)](#).

Referenced by [flags\(\)](#), [info\(\)](#), and [size\(\)](#).

Here is the call graph for this function:

Here is the caller graph for this function:

### 16.262.2.6 map()

```

long Dataspace::map (
    Dataspace::Offset offset,
    Dataspace::Flags flags,
    Dataspace::Map_addr local_addr,
    Dataspace::Map_addr min_addr,
    Dataspace::Map_addr max_addr,
    L4::Cap< L4::Task > dst = L4::Cap<L4::Task>::Invalid) const [noexcept]

```

Request a flexpage mapping from the dataspace.

#### Parameters

<i>offset</i>	Offset to start within dataspace
<i>flags</i>	<a href="#">Dataspace</a> flags, see <a href="#">L4Re::Dataspace::F::Flags</a> .
<i>local_addr</i>	Local address to map to.
<i>min_addr</i>	Defines start of receive window. (Rounded down to page size.)
<i>max_addr</i>	Defines end of receive window. (Rounded up to page size.)
<i>dst</i>	Optional destination task of the mapping. If invalid, the callers task is implicitly the destination.

### Return values

<i>L4_EOK</i>	Success
<i>-L4_ERANGE</i>	Invalid offset.
<i>-L4_EPERM</i>	Insufficient permission to map with requested rights.
<i>&lt;0</i>	IPC errors

The map call will attempt to map the largest possible flexpage that covers the given local address and still fits into the region defined by `min_addr` and `max_addr`. If the given region is invalid or does not overlap the local address, the smallest valid page size is used.

Definition at line 85 of file [dataspace\\_impl.h](#).

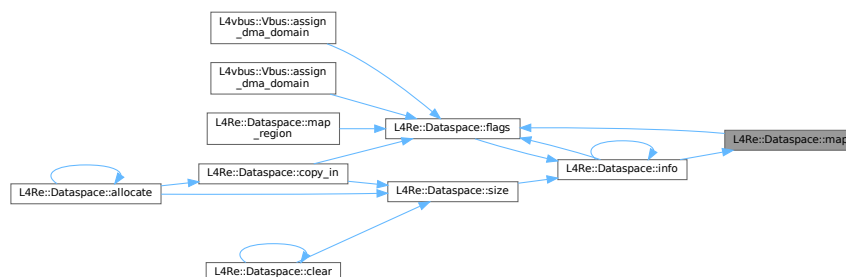

References [flags\(\)](#), and [L4\\_LOG2\\_PAGESIZE](#).

Referenced by [info\(\)](#).

Here is the call graph for this function:

Here is the caller graph for this function:

### 16.262.2.7 map\_info()

```
long L4Re::Dataspace::map_info (
    l4_addr_t * start_addr,
    l4_addr_t * end_addr) [inline]
```

Get mapping range of dataspace.

In case of a MMU-less system, the dataspace must be mapped at the correct address in the task because virtual and physical address must match. This method returns the start and end address of the physically contiguous buffer backing the dataspace.

On MMU-enabled system any page aligned address is permissible. On such systems the method is just a stub.

#### Parameters

out	<i>start_addr</i>	Start address of dataspace.
out	<i>end_addr</i>	End address (inclusive) of dataspace.

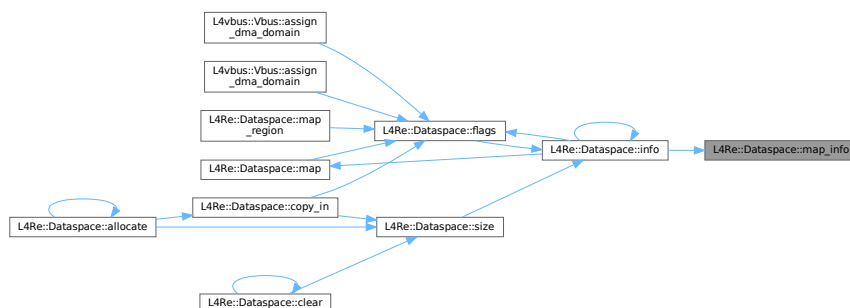

#### Return values

>0	Start/end address have been set and need to be obeyed.
0	No constraint of mapping address.
-L4_EPERM	Cannot infer mapping address. <a href="#">Dataspace</a> not mappable.
<0	IPC errors.

Definition at line 305 of file [dataspace](#).

Referenced by [info\(\)](#).

Here is the caller graph for this function:

### 16.262.2.8 map\_region()

```
long Dataspace::map_region (
    Dataspace::Offset offset,
    Dataspace::Flags flags,
    Dataspace::Map_addr min_addr,
    Dataspace::Map_addr max_addr,
    L4::Cap< L4::Task > dst = L4::Cap<L4::Task>::Invalid) const [noexcept]
```

Map a part of a dataspace into a local memory area.

#### Parameters

---

<i>offset</i>	Offset to start within dataspace.
<i>flags</i>	<a href="#">Dataspace</a> flags, see <a href="#">L4Re::Dataspace::F::Flags</a> .
<i>min_addr</i>	(Inclusive) start of the receive area.
<i>max_addr</i>	(Exclusive) end of receive area.
<i>dst</i>	Optional destination task of the mapping. If invalid, the callers task is implicitly the destination.

### Return values

<i>L4_EOK</i>	Success
<i>-L4_ERANGE</i>	Invalid offset or receive area larger than the dataspace.
<i>-L4_EPERM</i>	Insufficient permission to map with requested rights.
<i>&lt;0</i>	IPC errors

This is a convenience function which maps flexpages consecutively into the given memory area in the local task. The area is expected to be filled completely. If the dataspace is not large enough to provide the mappings for the entire size of the area, then an error is returned. Mappings may or may not have been already established at that point.

*offset* and *min\_addr* are rounded down to the next [L4\\_PAGESIZE](#) boundary when necessary. *max\_addr* is rounded up to the page boundary. If the resulting maximum address is less or equal than the minimum address, then the function is a noop.

Definition at line 45 of file [dataspace\\_impl.h](#).

References [flags\(\)](#), [L4\\_LOG2\\_PAGESIZE](#), [L4\\_UNLIKELY](#), [L4::round\\_order\(\)](#), and [L4::trunc\\_order\(\)](#).

Here is the call graph for this function:

#### 16.262.2.9 size()

```
Dataspace::Size Dataspace::size () const [noexcept]
```

Get size of a dataspace.

**Returns**

Size of the dataspace in bytes.

Definition at line 101 of file [dataspace\\_impl.h](#).

References [info\(\)](#), and [L4Re::Dataspace::Stats::size](#).

Referenced by [allocate\(\)](#), [clear\(\)](#), and [copy\\_in\(\)](#).

## 16.267.1 Detailed Description

Managed DMA Address Space.

A managed [Dma\\_space](#) represents the [L4Re](#) abstraction of an DMA address space of one or several devices. Devices are assigned to a managed [Dma\\_space](#) by binding the [Dma\\_space](#) to the respective DMA domain (see [L4vbus::Vbus::assign\\_dma\\_domain\(\)](#)), which might link the [Dma\\_space](#) with a kernel [DMA space](#). Note that several DMA domains can be bound to the same [Dma\\_space](#). Whenever a device needs direct access to parts of an [L4Re::Dataspace](#), that part of the data space must be mapped to the managed [Dma\\_space](#) that is assigned to that device. Binding to DMA domains must happen before mapping. After the DMA accesses to the memory are finished the memory must be unmapped from the device's DMA address space.

Mapping to a managed DMA address space, using [map\(\)](#), makes the given parts of the data space visible to the associated device at the returned DMA address. As long as the memory is mapped into a DMA space it is 'pinned' and cannot be subject to dynamic memory management such as swapping. Additionally, [map\(\)](#) is responsible for the necessary syncing operations before the DMA.

[unmap\(\)](#) is the reverse operation to [map\(\)](#) and unmaps the given data-space part for the DMA address space. [unmap\(\)](#) is responsible for the necessary sync operations after the DMA.

Definition at line 52 of file [dma\\_space](#).

## 16.267.2 Member Typedef Documentation

### 16.267.2.1 Attributes

```
typedef L4::Types::Flags<Attribute> L4Re::Dma_space::Attributes
```

[Attributes](#) for DMA mappings.

See also

[Attribute](#)

Definition at line 97 of file [dma\\_space](#).

## 16.267.3 Member Enumeration Documentation

### 16.267.3.1 Attribute

```
enum L4Re::Dma_space::Attribute
```

[Attributes](#) used for the memory region during the transfer.

See also

[Attributes](#)

### Enumerator

No_sync	Do not sync the memory hierarchy. When this flag is <i>not set</i> (default) the memory region shall be made coherent to the point-of-coherency of the device associated with this <a href="#">Dma_space</a> . When using this attribute the client is responsible for syncing the memory hierarchy for DMA. This can either be done using the cache API or by another <a href="#">map()</a> or <a href="#">unmap()</a> operation of the same part of the data space (without the <a href="#">No_sync</a> attribute).
---------	---

Definition at line 76 of file [dma\\_space](#).

### 16.267.3.2 Direction

```
enum L4Re::Dma_space::Direction
```

[Direction](#) of the DMA transfers.

#### Enumerator

Bidirectional	device reads and writes to the memory
To_device	device reads the memory
From_device	device writes to the memory
None	device is coherently connected to the memory

Definition at line 64 of file [dma\\_space](#).

### 16.267.3.3 Space\_attrib

```
enum L4Re::Dma_space::Space_attrib
```

[Attributes](#) assigned to the DMA space when associated with a specific device.

See also

[Space\\_attribs](#)

#### Enumerator

Coherent	The device is connected coherently with the cache. This means that the <a href="#">map()</a> and <a href="#">unmap()</a> do not need to sync CPU caches before and after DMA.
Phys_space	The DMA space has no DMA task assigned and uses the CPUs physical memory.

Definition at line 104 of file [dma\\_space](#).

## 16.267.4 Member Function Documentation

### 16.267.4.1 associate()

```
long L4Re::Dma_space::associate (
    L4::Ipc::Opt< L4::Ipc::Cap< L4::Task > > dma_task,
    Space_attribs attr)
```

Associate a (kernel) [DMA space](#) for a device to this [Dma\\_space](#).

#### Parameters

in	<i>dma_task</i>	The (kernel) <a href="#">DMA space</a> used for the device that shall be associated with this DMA space. In case no IOMMU is present or configured, the <i>dma_task</i> might be an invalid capability when <a href="#">L4Re::Dma_space::Phys_space</a> is set in <i>attr</i> , in this case the CPUs physical memory is used as DMA address space.
in	<i>attr</i>	<a href="#">Attributes</a> for this DMA space. See <a href="#">L4Re::Dma_space::Space_attrib</a> .

### Return values

<i>L4_EOK</i>	Operation successful.
<i>-L4_EPERM</i>	Insufficient permissions; see precondition.
<i>-L4_EINVAL</i>	
<i>-L4_ENOENT</i>	

### Precondition

The invoked [Dma\\_space](#) capability must have the permission [L4\\_CAP\\_FPAGE\\_W](#).

References [disassociate\(\)](#).

Referenced by [unmap\(\)](#).

Here is the call graph for this function:

Here is the caller graph for this function:

#### 16.267.4.2 disassociate()

```
long L4Re::Dma_space::disassociate ()
```

Disassociate the (kernel) [DMA space](#) from this [Dma\\_space](#).

### Return values

<code>L4_EOK</code>	Operation successful.
<code>-L4_EPERM</code>	Insufficient permissions; see precondition.
<code>-L4_ENOENT</code>	

#### Precondition

The invoked `Dma_space` capability must have the permission `L4_CAP_FPAGE_W`.

Referenced by `associate()`.

Here is the caller graph for this function:

### 16.267.4.3 map()

```

long L4Re::Dma_space::map (
    L4::Ipc::Cap< L4Re::Dataspace > src,
    L4Re::Dataspace::Offset offset,
    L4::Ipc::In_out< l4_size_t * > size,
    Attributes attrs,
    Direction dir,
    Dma_addr * dma_addr)

```

Map the given part of this data space into the DMA address space.

#### Parameters

in	<code>src</code>	Source data space (that describes the memory). Caller needs write right to the data space.
in	<code>offset</code>	The offset (bytes) within <code>src</code> .
in, out	<code>size</code>	The size (bytes) of the region to be mapped for DMA, after successful mapping the size returned is the size mapped for DMA as a single block. This size might be smaller than the original input size, in this case the caller might call <code>map()</code> again with a new offset and the remaining size.
in	<code>attrs</code>	The attributes used for this DMA mapping (a combination of <code>Dma_space::Attribute</code> values).
in	<code>dir</code>	The direction of the DMA transfer issued with this mapping. The same value must later be passed to <code>unmap()</code> .
out	<code>dma_addr</code>	The DMA address to use for DMA with the associated device.

#### Return values

<i>L4_EOK</i>	Operation successful.
<i>-L4_EPERM</i>	Insufficient permissions; see precondition.
<i>-L4_EINVAL</i>	The capability <i>src</i> is invalid or does not refer to a valid dataspace.
<i>-L4_EEXIST</i>	The specified region overlaps an existing mapping.
<i>-L4_ENOMEM</i>	Not enough memory to allocate internal datastructures.
<i>-L4_ERANGE</i>	<i>offset</i> is larger than the size of the dataspace.

**Precondition**

The capability *src* must have the permission [L4\\_CAP\\_FPAGE\\_W](#).

**Note**

[associate\(\)](#) must be called prior to mapping memory. Usually this is done implicitly when binding the managed [Dma\\_space](#) to a DMA domain (see [L4vbus::Vbus::assign\\_dma\\_domain\(\)](#)).

References [unmap\(\)](#).

Here is the call graph for this function:

**16.267.4.4 unmap()**

```

long L4Re::Dma_space::unmap (
    Dma_addr dma_addr,
    l4_size_t size,
    Attributes attrs,
    Direction dir)
  
```

Unmap the given part of this data space from the DMA address space.

**Parameters**

<i>dma_addr</i>	The DMA address (returned by <a href="#">Dma_space::map()</a> ).
<i>size</i>	The size (bytes) of the memory region to unmap.
<i>attrs</i>	The attributes for the unmap (currently none).
<i>dir</i>	The direction of the finished DMA operation.

**Returns**

0 in the case of success, a negative error code otherwise.

References [associate\(\)](#).

Referenced by [map\(\)](#).

Here is the call graph for this function:

Here is the caller graph for this function:

## 16.268.1 Detailed Description

C++ interface of the initial environment that is provided to an [L4](#) task.

The initial environment is provided to each [L4](#) task that is started by an [L4Re](#) conform loader, such as the Moe root task. The initial environment provides access to a set of initial capabilities and some additional information about the available resources, such as free UTCBs (see [Virtual Registers](#) ) and available entries in capability table (provided by the micro kernel).

Each of the initial capabilities is stored at a fixed index in the task's capability table and the [L4](#) runtime environment provides convenience functions to retrieve the capabilities. See the table below for an comprehensive overview.

Name	Object Type	Convenience Function
parent	<a href="#">L4Re::Parent</a>	<a href="#">L4Re::Env::parent()</a>
user_factory	<a href="#">L4::Factory</a>	<a href="#">L4Re::Env::user_factory()</a>
log	<a href="#">L4Re::Log</a>	<a href="#">L4Re::Env::log()</a>
main_thread	<a href="#">L4::Thread</a>	<a href="#">L4Re::Env::main_thread()</a>
rm	<a href="#">L4Re::Rm</a>	<a href="#">L4Re::Env::rm()</a>
factory	<a href="#">L4::Factory</a>	<a href="#">L4Re::Env::factory()</a>
task	<a href="#">L4::Task</a>	<a href="#">L4Re::Env::task()</a>
scheduler	<a href="#">L4::Scheduler</a>	<a href="#">L4Re::Env::scheduler()</a>
itas	<a href="#">L4Re::Itas</a>	<a href="#">L4Re::Env::itas()</a>

Additional information found in the initial environment is:

- First free entry in capability table
- The [UTCB](#) area (as flexpage)
- First free UTCB (address in the UTCB area)

### Include File

```
#include <l4/re/env>
```

For an explanation of the default task capabilities see [l4\\_default\\_caps\\_t](#).

For the C interface refer to [Initial Environment](#).

Definition at line 78 of file [env](#).

## 16.268.2 Member Function Documentation

### 16.268.2.1 dbg\_events() [1/2]

```
L4::Cap< Dbg_events > L4Re::Env::dbg_events () const [inline], [noexcept]
```

Object-capability to a debugger events service.

**Returns**

Dbg\_events object-capability

This capability can be invalid.

Definition at line 310 of file [env](#).

Referenced by [dbg\\_events\(\)](#).

Here is the caller graph for this function:

**16.268.2.2 dbg\_events() [2/2]**

```
void L4Re::Env::dbg_events (
    L4::Cap< Dbg_events > const & dbg_events) [inline], [noexcept]
```

Set the dbg\_events capability.

**Parameters**

<i>dbg_events</i>	is the capability to be set for the debug events service.
-------------------	---

Note that the capability can be invalid.

Definition at line 320 of file [env](#).

References [dbg\\_events\(\)](#).

Here is the call graph for this function:

### 16.268.2.3 env()

```
Env const * L4Re::Env::env () [inline], [static], [noexcept]
```

Returns the initial environment for the current task.

#### Returns

Pointer to the initial environment class.

A typical use of this function is `L4Re::Env::env()-><member>()`

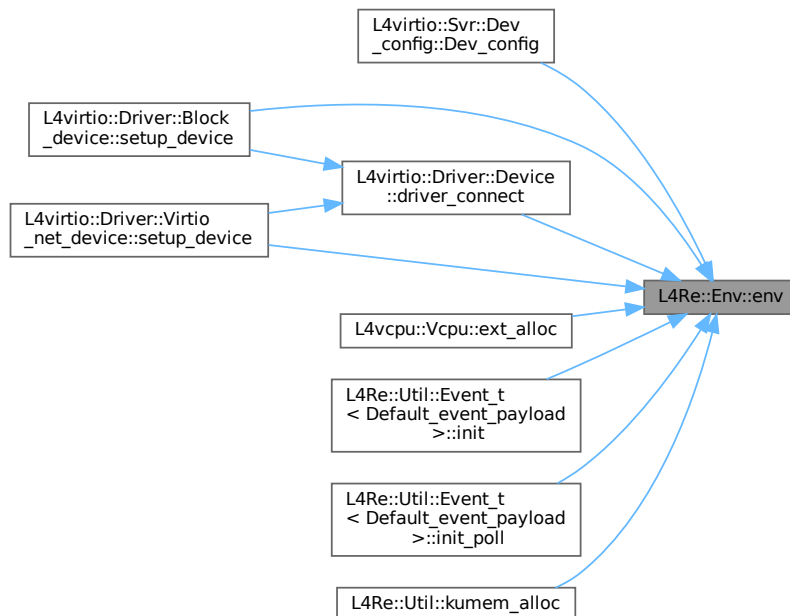

#### Examples

`examples/clntsrv/src/client.cc`, `examples/libs/l4re/c++/mem_alloc/ma+rm.cc`, `examples/libs/l4re/c++/shared_ds/ds_clnt.cc`, `examples/libs/l4re/c++/shared_ds/ds_srv.cc`, `examples/libs/l4re/streammap/client.cc`, and `examples/sys/migrate/thread_migrate.cc`

Definition at line 96 of file `env`.

Referenced by `L4virtio::Svr::Dev_config::Dev_config()`, `L4virtio::Driver::Device::driver_connect()`, `L4vcpu::Vcpu::ext_alloc()`, `L4Re::Util::Event_t< Default_event_payload >::init()`, `L4Re::Util::Event_t< Default_event_payload >::init_poll()`, `L4Re::Util::kumem_alloc()`, `L4virtio::Driver::Block_device::setup_device()`, and `L4virtio::Driver::Virtio_net_device::setup_device()`.

Here is the caller graph for this function:

**16.268.2.4 factory()** [1/2]

```
L4::Cap< L4::Factory > L4Re::Env::factory () const [inline], [noexcept]
```

Object-capability to the factory object available to the task.

**Returns**

Factory object-capability

Definition at line 144 of file [env](#).

**16.268.2.5 factory()** [2/2]

```
void L4Re::Env::factory (
    L4::Cap< L4::Factory > const & c) [inline], [noexcept]
```

Set factory object-capability.

**Parameters**

<i>c</i>	Factory object-capability
----------	---------------------------

Definition at line 249 of file [env](#).

**16.268.2.6 first\_free\_cap()** [1/2]

```
l4_cap_idx_t L4Re::Env::first_free_cap () const [inline], [noexcept]
```

First available capability selector.

**Returns**

First capability selector.

First capability selector available for use for in the application.

Definition at line 152 of file [env](#).

**16.268.2.7 first\_free\_cap()** [2/2]

```
void L4Re::Env::first_free_cap (
    l4_cap_idx_t c) [inline], [noexcept]
```

Set first available capability selector.

**Parameters**

<i>c</i>	First capability selector available to the application.
----------	---

Definition at line 255 of file [env](#).

### 16.268.2.8 first\_free\_utcb() [1/2]

```
l4_addr_t L4Re::Env::first_free_utcb () const [inline], [noexcept]
```

First free UTCB.

#### Returns

object-capability

First free UTCB within the UTCB area available for the application to use.

Definition at line 167 of file [env](#).

### 16.268.2.9 first\_free\_utcb() [2/2]

```
void L4Re::Env::first_free_utcb (
    l4_addr_t u) [inline], [noexcept]
```

Set first free UTCB.

#### Parameters

<i>u</i>	First UTCB available for the application to use.
----------	--

Definition at line 267 of file [env](#).

### 16.268.2.10 get()

```
Cap_entry const * L4Re::Env::get (
    char const * name,
    unsigned l) const [inline], [noexcept]
```

Get the [Cap\\_entry](#) for the object named *name*.

#### Parameters

<i>name</i>	is the name of the object.
<i>l</i>	is the length of the name, thus <i>name</i> might not be zero terminated.

**Returns**

A pointer to the [Cap\\_entry](#) for the object named *name*, or NULL if no such object was found.

Definition at line 185 of file [env](#).

References [l4re\\_env\\_get\\_cap\\_l\(\)](#).

Referenced by [get\\_cap\(\)](#).

Here is the call graph for this function:

Here is the caller graph for this function:

**16.268.2.11 get\_cap() [1/2]**

```

template<typename T>
L4::Cap< T > L4Re::Env::get_cap (
    char const * name) const [inline], [noexcept]
  
```

Get the capability selector for the object named *name*.

**Parameters**

<i>name</i>	is the name of the object (zero terminated).
-------------	--

**Returns**

A capability selector for the object named *name*, or an invalid capability selector if no such object was found.

Definition at line 212 of file [env](#).

References [get\\_cap\(\)](#).

Here is the call graph for this function:

### 16.268.2.12 get\_cap() [2/2]

```
template<typename T>
L4::Cap< T > L4Re::Env::get_cap (
    char const * name,
    unsigned l) const [inline], [noexcept]
```

Get the capability selector for the object named *name*.

#### Parameters

<i>name</i>	is the name of the object.
<i>l</i>	is the length of the name, thus <i>name</i> might not be zero terminated.

#### Returns

A capability selector for the object named *name*, or an invalid capability selector if no such object was found.

#### Examples

[examples/clntsrv/src/client.cc](#), [examples/libs/l4re/c++/shared\\_ds/ds\\_clnt.cc](#), and [examples/libs/l4re/streammap/client.cc](#).

Definition at line 197 of file [env](#).

Here is the caller graph for this function:

**16.268.2.13 initial\_caps()** [1/2]

```
Cap_entry const * L4Re::Env::initial_caps () const [inline], [noexcept]
```

Get a pointer to the first entry in the initial objects array.

**Returns**

A pointer to the first entry in the initial objects array.

Definition at line 174 of file [env](#).

**16.268.2.14 initial\_caps()** [2/2]

```
void L4Re::Env::initial_caps (
    Cap_entry * first) [inline], [noexcept]
```

Set the pointer to the first [Cap\\_entry](#) in the initial objects array.

**Parameters**

<i>first</i>	is the first element in the array.
--------------	------------------------------------

Definition at line 327 of file [env](#).

**16.268.2.15 itas()** [1/2]

```
L4::Cap< Itas > L4Re::Env::itas () const [inline], [noexcept]
```

Object-capability to the ITAS services.

**Returns**

ITAS object-capability

Attention: this capability might be invalid, depending on the system configuration. Regular applications must not use it directly as it is an implementation detail of the [L4Re](#) libc that is subject to change without notice!

Definition at line 294 of file [env](#).

**16.268.2.16 itas()** [2/2]

```
void L4Re::Env::itas (
    L4::Cap< Itas > const & c) [inline], [noexcept]
```

Set the ITAS capability.

**Parameters**

<code>c</code>	is the capability to be set as ITAS.
----------------	--------------------------------------

Definition at line 301 of file [env](#).

### 16.268.2.17 log() [1/2]

```
L4::Cap< Log > L4Re::Env::log () const [inline], [noexcept]
```

Object-capability to the logging service.

#### Returns

[Log](#) object-capability

Definition at line 126 of file [env](#).

### 16.268.2.18 log() [2/2]

```
void L4Re::Env::log (
    L4::Cap< Log > const & c) [inline], [noexcept]
```

Set log object-capability.

#### Parameters

<code>c</code>	<a href="#">Log</a> object-capability
----------------	---------------------------------------

Definition at line 237 of file [env](#).

### 16.268.2.19 main\_thread() [1/2]

```
L4::Cap< L4::Thread > L4Re::Env::main_thread () const [inline], [noexcept]
```

Object-capability of the first user thread.

#### Returns

Object-capability of the first user thread.

Definition at line 132 of file [env](#).

### 16.268.2.20 main\_thread() [2/2]

```
void L4Re::Env::main_thread (
    L4::Cap< L4::Thread > const & c) [inline], [noexcept]
```

Set object-capability of first user thread.

#### Parameters

<code>c</code>	First thread's object-capability
----------------	----------------------------------

Definition at line 243 of file [env](#).

#### 16.268.2.21 `mem_alloc()` [1/2]

```
L4::Cap< Mem_alloc > L4Re::Env::mem_alloc () const [inline], [noexcept]
```

Object-capability to the memory allocator.

##### Returns

Memory allocator object-capability

##### Examples

[examples/libs/l4re/c++/shared\\_ds/ds\\_srv.cc](#).

Definition at line 109 of file [env](#).

#### 16.268.2.22 `mem_alloc()` [2/2]

```
void L4Re::Env::mem_alloc (
    L4::Cap< Mem_alloc > const & c) [inline], [noexcept]
```

Set memory allocator object-capability.

##### Parameters

<code>c</code>	Memory allocator object-capability
----------------	------------------------------------

Definition at line 225 of file [env](#).

#### 16.268.2.23 `parent()` [1/2]

```
L4::Cap< Parent > L4Re::Env::parent () const [inline], [noexcept]
```

Object-capability to the parent.

##### Returns

[Parent](#) object-capability

Definition at line 103 of file [env](#).

#### 16.268.2.24 `parent()` [2/2]

```
void L4Re::Env::parent (
    L4::Cap< Parent > const & c) [inline], [noexcept]
```

Set parent object-capability.

##### Parameters

c	Parent object-capability
---	--------------------------

Definition at line 219 of file [env](#).

#### 16.268.2.25 rm() [1/2]

```
L4::Cap< Rm > L4Re::Env::rm () const [inline], [noexcept]
```

Object-capability to the region map.

##### Returns

Region map object-capability

##### Examples

[examples/libs/l4re/c++/shared\\_ds/ds\\_clnt.cc](#), and [examples/libs/l4re/c++/shared\\_ds/ds\\_srv.cc](#).

Definition at line 120 of file [env](#).

#### 16.268.2.26 rm() [2/2]

```
void L4Re::Env::rm (
    L4::Cap< Rm > const & c) [inline], [noexcept]
```

Set region map object-capability.

##### Parameters

c	Region map object-capability
---	------------------------------

Definition at line 231 of file [env](#).

#### 16.268.2.27 scheduler() [1/2]

```
L4::Cap< L4::Scheduler > L4Re::Env::scheduler () const [inline], [noexcept]
```

Get the scheduler capability for the task.

##### Returns

The capability selector for the default scheduler used for this task.

Definition at line 275 of file [env](#).

#### 16.268.2.28 scheduler() [2/2]

```
void L4Re::Env::scheduler (
    L4::Cap< L4::Scheduler > const & c) [inline], [noexcept]
```

Set the scheduler capability.

##### Parameters

<i>c</i>	is the capability to be set as scheduler.
----------	---

Definition at line 282 of file [env](#).

#### 16.268.2.29 task()

```
L4::Cap< L4::Task > L4Re::Env::task () const [inline], [noexcept]
```

Object-capability of the user task.

##### Returns

Object-capability of the user task.

Definition at line 138 of file [env](#).

#### 16.268.2.30 utcb\_area() [1/2]

```
l4_fpage_t L4Re::Env::utcb_area () const [inline], [noexcept]
```

UTCB area of the task.

##### Returns

UTCB area

Definition at line 158 of file [env](#).

#### 16.268.2.31 utcb\_area() [2/2]

```
void L4Re::Env::utcb_area (
    l4_fpage_t utcbs) [inline], [noexcept]
```

Set UTCB area of the task.

##### Parameters

<i>utcbs</i>	UTCB area
--------------	-----------

Definition at line 261 of file [env](#).

## 16.272.1 Detailed Description

Set of inhibitor locks, which inhibit specific actions when held.

This interface provides access to a set of inhibitor locks, each determined by an ID that is specific to the [Inhibitor](#) object. Each individual lock shall prevent, a specific (implementation defined) action to be executed, as long as the lock is held.

For example there can be an inhibitor lock to prevent a transition to suspend-to-RAM state and a different one to prevent shutdown.

A client shall take an inhibitor lock if it needs to execute code before the action is taken. For example a lock-screen application shall grab an inhibitor lock for the suspend action to be able to lock the screen before the system goes to sleep.

[Inhibitor](#) locks are usually closely related to specific events. Usually a server automatically subscribes a client holding a lock to the corresponding event. The server shall send the event to inform the client that an action is pending. Upon reception of the event, the client is supposed to release the corresponding inhibitor lock.

Definition at line 38 of file [inhibitor](#).

## 16.272.2 Member Enumeration Documentation

### 16.272.2.1 anonymous enum

anonymous enum

#### Enumerator

---

Name_max	The maximum length of a lock's name.
----------	--------------------------------------

Definition at line 42 of file [inhibitor](#).

## 16.272.3 Member Function Documentation

### 16.272.3.1 acquire()

```
long L4Re::Inhibitor::acquire (  
    l4_umword_t id,  
    L4::Ipc::String<> reason)
```

Acquire a specific inhibitor lock.

#### Parameters

<i>id</i>	ID of the inhibitor lock that the client intends to acquire
<i>reason</i>	The reason why you need the lock. Used for informing the user or debugging.

#### Return values

0	Success
-L4_ENODEV	The specified <i>id</i> does not exist.

References [acquire\(\)](#).

Referenced by [acquire\(\)](#).

Here is the call graph for this function:

Here is the caller graph for this function:

### 16.272.3.2 next\_lock\_info()

```
long L4Re::Inhibitor::next_lock_info (
    char * name,
    unsigned len,
    l4_mword_t current_id = -1,
    l4_utcb_t * utcb = l4_utcb()) [inline]
```

Get information for the next available inhibitor lock.

#### Parameters

<i>name</i>	A pointer to a buffer for the name of the lock.
<i>len</i>	The length of the available buffer (usually <a href="#">Name_max</a> is used).
<i>current_id</i>	The ID of the last available lock, use -1 to get the first lock.
<i>utcb</i>	The UTCB to use for the message.

#### Return values

<i>&gt;0</i>	The ID of the next available lock if there is one (in this case <i>name</i> shall contain the name of the inhibitor lock).
<i>-L4_ENODEV</i>	There are no more locks.

Definition at line 84 of file [inhibitor](#).

## 16.273 L4Re::Itas Class Reference

Interface to the ITAS.

```
#include <itas>
```

Inheritance diagram for L4Re::Itas:

Collaboration diagram for L4Re::Itas:

## Public Types

- enum : unsigned { `ignore_sigaction` = ~0U }

## Public Member Functions

- int `register_thread` (L4::lpc::Cap< L4::Thread > parent, L4::lpc::Cap< L4::Thread > thread\_cap, l4\_addr\_t thread\_utcb)

- *Register new thread.*
- `int unregister_thread (L4::lpc::Cap< L4::Thread > thread)`
- *Unregister a thread.*
- `int sigaction (int signum, const struct sigaction *act, struct sigaction *oldact)`
- *Examine and change a POSIX signal action.*
- `int sigaltstack (L4::lpc::Cap< L4::Thread > thread, const struct sigaltstack *ss, struct sigaltstack *oss)`
- *Examine or set alternate POSIX signal stack.*
- `int sigprocmask (L4::lpc::Cap< L4::Thread > thread, int how, sigset_t const *set, sigset_t *oldset)`
- *Examine or set process signal mask.*
- `int sigpending (L4::lpc::Cap< L4::Thread > thread, sigset_t *set)`
- *Query pending signals.*
- `int setitimer (int which, const struct itimerval *new_value, struct itimerval *old_value)`
- *Set process interval timer.*
- `int getitimer (int which, struct itimerval *curr_value)`
- *Get process interval timer.*
- `int raise (L4::lpc::Cap< L4::Thread > thread, int sig)`
- *Send a signal to the calling thread.*

## Public Member Functions inherited from L4::Kobject

- `l4_msgtag_t dec_refcnt (l4_mword_t diff, l4_utcb_t *utcb=l4_utcb())`
- *Decrement the in kernel reference counter for the object.*

## Additional Inherited Members

## Protected Types inherited from

**L4::Kobject\_t< Itas, L4::Kobject, L4RE\_PROTO\_ITAS, L4::Type\_info::Demand\_t< 2 > >**

- `typedef Itas Class`
- *The target interface type (inheriting from [Kobject\\_t](#)).*
- `typedef Typeid::Iface< PROTO, Itas > __Iface`
- *The interface description for the derived class.*
- `typedef Typeid::Merge_list< Typeid::Iface_list< __Iface >, typename L4::Kobject::__Iface_list > __Iface_list`
- *The list of all RPC interfaces provided directly or through inheritance.*

## Protected Member Functions inherited from

**L4::Kobject\_t< Itas, L4::Kobject, L4RE\_PROTO\_ITAS, L4::Type\_info::Demand\_t< 2 > >**

- `L4::Cap< Class > c () const noexcept`
- *Get the capability to ourselves.*

## Protected Member Functions inherited from L4::Kobject

- `l4_cap_idx_t cap () const noexcept`
- *Return capability selector.*

**Static Protected Member Functions inherited from****[L4::Kobject\\_t< Itas, L4::Kobject, L4RE\\_PROTO\\_ITAS, L4::Type\\_info::Demand\\_t< 2 > >](#)**

- static void **\_\_check\_protocols\_\_** () noexcept  
*Helper to check for protocol conflicts.*

**16.273.1 Detailed Description**

Interface to the ITAS.

This is an internal interface between libc and the l4re\_itas. Do not use it. It is subject to change.

Definition at line 30 of file [itas](#).

**16.273.2 Member Enumeration Documentation****16.273.2.1 anonymous enum**

```
anonymous enum : unsigned
```

**Enumerator**

Ignore_sigaction	Ignore new action of <a href="#">sigaction()</a> call.
------------------	--

Definition at line 63 of file [itas](#).

**16.273.3 Member Function Documentation****16.273.3.1 getitimer()**

```
int L4Re::Itas::getitimer (
    int which,
    struct itimerval * curr_value)
```

Get process interval timer.

See IEEE Std 1003.1-2017 [getitimer\(\)](#) for details.

**Parameters**

in	<i>which</i>	Timer type (ITIMER_REAL).
out	<i>curr_value</i>	Old timer value.

References [getitimer\(\)](#).

Referenced by [getitimer\(\)](#).

Here is the call graph for this function:

Here is the caller graph for this function:

### 16.273.3.2 raise()

```
int L4Re::Itas::raise (
    L4::Ipc::Cap< L4::Thread > thread,
    int sig)
```

Send a signal to the calling thread.

#### Parameters

in	<i>thread</i>	Thread cap of the calling thread.
in	<i>sig</i>	Signal that shall be raised.

References [raise\(\)](#).

Referenced by [raise\(\)](#).

Here is the call graph for this function:

Here is the caller graph for this function:

### 16.273.3.3 register\_thread()

```
int L4Re::Itas::register_thread (
    L4::Ipc::Cap< L4::Thread > parent,
    L4::Ipc::Cap< L4::Thread > thread_cap,
    l4_addr_t thread_utcb)
```

Register new thread.

Makes the newly created thread known to ITAS. The ITAS will do the `thread_cap->control()` to bind the thread to the task and attach the gates for pager and exception handler.

#### Parameters

<i>parent</i>	The capability of the thread that created the new thread.
<i>thread_cap</i>	The capability of the new thread.
<i>thread_utcb</i>	The address of the allocated UTCB of the new thread.

### 16.273.3.4 setitimer()

```
int L4Re::Itas::setitimer (
    int which,
    const struct itimerval * new_value,
    struct itimerval * old_value)
```

Set process interval timer.

See IEEE Std 1003.1-2017 [setitimer\(\)](#) for details.

#### Parameters

in	<i>which</i>	Timer type (ITIMER_REAL).
in	<i>new_value</i>	New timer value.
out	<i>old_value</i>	Old timer value.

Referenced by [sigpending\(\)](#).

Here is the caller graph for this function:

### 16.273.3.5 sigaction()

```
int L4Re::Itas::sigaction (
    int signum,
    const struct sigaction * act,
    struct sigaction * oldact)
```

Examine and change a POSIX signal action.

See IEEE Std 1003.1-2024 [sigaction\(\)](#) for the behaviour of the method.

If `act->sa_flags` is [Ignore\\_sigaction](#), the new action is ignored.

#### Parameters

in	<i>signum</i>	Signal number to be examined and/or modified.
in	<i>act</i>	New signal action.
out	<i>oldact</i>	Old signal action.

References [sigaction\(\)](#), and [sigaltstack\(\)](#).

Referenced by [sigaction\(\)](#).

Here is the call graph for this function:

Here is the caller graph for this function:

### 16.273.3.6 sigaltstack()

```
int L4Re::Itas::sigaltstack (
    L4::Ipc::Cap< L4::Thread > thread,
    const struct sigaltstack * ss,
    struct sigaltstack * oss)
```

Examine or set alternate POSIX signal stack.

See IEEE Std 1003.1-2024 [sigaltstack\(\)](#) for the behaviour of the method.

If `ss->ss_flags` is -1, the new sigaltstack will be ignored.

#### Parameters

in	<i>thread</i>	Thread cap of the thread whose sigaltstack is examined and/or modified.
in	<i>ss</i>	The new sigaltstack.
out	<i>oss</i>	The old sigaltstack.

References [sigaltstack\(\)](#), and [sigprocmask\(\)](#).

Referenced by [sigaction\(\)](#), and [sigaltstack\(\)](#).

Here is the call graph for this function:

Here is the caller graph for this function:

### 16.273.3.7 sigpending()

```
int L4Re::Itas::sigpending (
    L4::Ipc::Cap< L4::Thread > thread,
    sigset_t * set)
```

Query pending signals.

See IEEE Std 1003.1-2024 [sigpending\(\)](#) for details.

#### Parameters

in	<i>thread</i>	Thread cap of the thread whose pending signal are examined.
out	<i>set</i>	Pending signals of thread.

References [setitimer\(\)](#).

Referenced by [sigprocmask\(\)](#).

Here is the call graph for this function:

Here is the caller graph for this function:

### 16.273.3.8 sigprocmask()

```

int L4Re::Itas::sigprocmask (
    L4::Ipc::Cap< L4::Thread > thread,
    int how,
    sigset_t const * set,
    sigset_t * oldset)
  
```

Examine or set process signal mask.

See IEEE Std 1003.1-2024 [sigprocmask\(\)](#) for the behaviour or the method.

If `how` is `-1`, the signal mask is left unchanged.

#### Parameters

in	<i>thread</i>	Thread cap of the thread whose signal mask is examined and/or modified.
in	<i>how</i>	Operation ( <code>SIG_BLOCK</code> , <code>SIG_UNBLOCK</code> , <code>SIG_SETMASK</code> or <code>-1</code> ).
in	<i>set</i>	The new signal mask.
out	<i>oldset</i>	The old signal mask.

References [sigpending\(\)](#).

Referenced by [sigaltstack\(\)](#).

Here is the call graph for this function:

Here is the caller graph for this function:

### 16.273.3.9 unregister\_thread()

```
int L4Re::Itas::unregister_thread (
    L4::Ipc::Cap< L4::Thread > thread)
```

Unregister a thread.

The gates for the thread's pager and exception handler will be destroyed. Thus, the thread must be destroyed after the call.

#### Parameters

<i>thread</i>	The destroyed thread.
---------------	-----------------------

References [unregister\\_thread\(\)](#).

Referenced by [unregister\\_thread\(\)](#).

Here is the call graph for this function:

Here is the caller graph for this function:

**16.275.1 Detailed Description**

Memory allocation interface.

The memory-allocator API is the basic API to allocate memory from the [L4Re](#) subsystem. The memory is allocated in terms of dataspace (see [L4Re::Dataspace](#)). The provided dataspace have at least the property that data written to such a dataspace is available as long as the dataspace is not freed or the data is not overwritten. In particular, the memory backing a dataspace from an allocator need not be allocated instantly, but may be allocated lazily on demand.

A memory allocator can provide dataspace with additional properties, such as physically contiguous memory, pre-allocated memory, or pinned memory. To request memory with an additional property the [L4Re::Mem\\_alloc::alloc\(\)](#) method provides a flags parameter. If the concrete implementation of a memory allocator does not support or allow allocation of memory with a certain property, the allocation may be refused.

Definition at line 52 of file [mem\\_alloc](#).

## 16.275.2 Member Enumeration Documentation

### 16.275.2.1 Mem\_alloc\_flags

```
enum L4Re::Mem_alloc::Mem_alloc_flags
```

Flags for the allocator.

They describe requested properties of the allocated memory. Support of these properties by the dataspace provider is optional.

#### Enumerator

Continuous	Allocate physically contiguous memory.
Pinned	Deprecated, use <a href="#">L4Re::Dma_space</a> instead.
Super_pages	Allocate super pages.
Fixed_paddr	Allocate at fixed physical address. Only honored on no-MMU systems. Will fail on MMU systems.

Definition at line 62 of file [mem\\_alloc](#).

## 16.275.3 Member Function Documentation

### 16.275.3.1 alloc()

```
long L4Re::Mem_alloc::alloc (
    long size,
    L4::Cap< Dataspace > mem,
    unsigned long flags = 0,
    unsigned long align = 0,
    l4_addr_t paddr = 0) const [noexcept]
```

Allocate anonymous memory.

#### Parameters

	<i>size</i>	Size in bytes to be requested. Allocation granularity is (super)pages, however, the allocator will store the byte-granular given size as the size of the dataspace and consecutively will use this byte-granular size for servicing the dataspace. Allocators may optionally also implement a maximum allocation strategy: if <i>size</i> is a negative value and <i>flags</i> set the <a href="#">Mem_alloc_flags::Continuous</a> bit, the allocator tries to allocate as much memory as possible leaving an amount of at least <i>-size</i> bytes within the associated quota.
out	<i>mem</i>	Capability slot where the capability to the dataspace is received.
	<i>flags</i>	Special dataspace properties, see <a href="#">Mem_alloc_flags</a>
	<i>align</i>	Log2 alignment of dataspace if supported by allocator, will be at least L4_PAGESHIFT, with Super_pages flag set at least L4_SUPERPAGESHIFT
	<i>paddr</i>	The physical address where the dataspace should be allocated if <a href="#">Mem_alloc_flags::Fixed</a> flag is set.

#### Return values

<i>0</i>	Success
<i>-L4_ERANGE</i>	Given size not supported.
<i>-L4_ENOMEM</i>	Not enough memory available.
<i>&lt;0</i>	IPC error

Definition at line 24 of file [mem\\_alloc\\_impl.h](#).

References [L4::Kobject::cap\(\)](#), [Fixed\\_paddr](#), and [l4\\_error\(\)](#).

Here is the call graph for this function:

### 16.275.3.2 info()

```
long L4Re::Mem_alloc::info (
    Stats & stats)
```

Get allocator information.

#### Parameters

out	stats	Allocator information
-----	-------	-----------------------

#### Return values

<i>0</i>	Success
<i>&lt;0</i>	IPC error

References [info\(\)](#), and [L4\\_INLINE\\_RPC](#).

### Data Fields

- [l4\\_size\\_t quota](#)  
*Memory quota of this allocator.*
- [l4\\_size\\_t quota\\_used](#)  
*Amount of currently used quota of this allocator.*
- [l4\\_size\\_t mem\\_limit](#)  
*Maximum amount of memory that can be allocated by this allocator.*
- [l4\\_size\\_t mem\\_used](#)  
*Amount of currently allocated memory.*
- [l4\\_size\\_t mem\\_free](#)  
*Amount of memory that is still available for allocation.*

## 16.276.1 Detailed Description

Statistics about memory-allocator.

Definition at line 74 of file [mem\\_alloc](#).

## 16.276.2 Field Documentation

### 16.276.2.1 mem\_free

`l4_size_t L4Re::Mem_alloc::Stats::mem_free`

Amount of memory that is still available for allocation.

This field can be lower than `mem_limit - mem_used`. In this case the system may be over-committed and there is globally not enough memory left. Also, if the quota is already used up for sub-factories (see `quota_used`), there may be not enough quota left.

Definition at line 126 of file [mem\\_alloc](#).

### 16.276.2.2 mem\_limit

`l4_size_t L4Re::Mem_alloc::Stats::mem_limit`

Maximum amount of memory that can be allocated by this allocator.

Will never exceed the `quota` but may be smaller if the system has less memory installed.

Definition at line 102 of file [mem\\_alloc](#).

### 16.276.2.3 mem\_used

`l4_size_t L4Re::Mem_alloc::Stats::mem_used`

Amount of currently allocated memory.

This field represents the amount of memory that is in use by this allocator. It recursively includes the memory used by sub-factories, if any.

Will never exceed `mem_limit` or `quota_used`.

#### Note

Dataspaces may allocate memory lazily! As such, the field will increase only after pages have been allocated to a dataspace.

Definition at line 116 of file [mem\\_alloc](#).

#### 16.276.2.4 quota

```
l4_size_t L4Re::Mem_alloc::Stats::quota
```

Memory quota of this allocator.

Strictly limits the amount of memory that can be allocated. This may be larger than there is actual physical memory available. In particular, the root factory has an artificial quota and returns -1 in this field.

Definition at line 83 of file [mem\\_alloc](#).

#### 16.276.2.5 quota\_used

```
l4_size_t L4Re::Mem_alloc::Stats::quota_used
```

Amount of currently used quota of this allocator.

The amount of used quota is not necessarily linked to the current memory usage. See [mem\\_used](#) for this information. The quota of a factory is immediately and fully accounted to the parent factory quota.

This value may even exceed [mem\\_limit](#) if the system is over-committed.

Definition at line 94 of file [mem\\_alloc](#).

The documentation for this struct was generated from the following file:

- [l4/re/mem\\_alloc](#)

## 16.277 L4Re::Mmio\_space Struct Reference

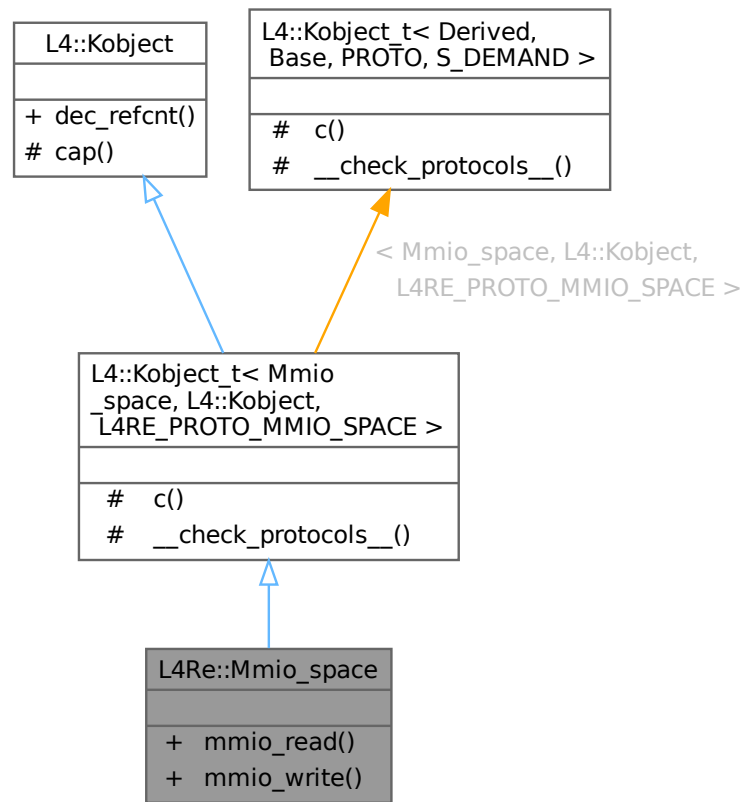

Interface for memory-like address space accessible via IPC.

```

## 16.277.1 Detailed Description

Interface for memory-like address space accessible via IPC.

This interface defines methods for indirect access to MMIO regions.

Memory mapped IO (MMIO) is used by device drivers to control hardware devices. Access to MMIO regions is assigned to user-level device drivers via mappings of memory pages.

However, there are hardware platforms where MMIO regions for different devices share the same memory page. With respect to security and safety, it is often not allowed to map a memory page to multiple device drivers because the driver of one device could then influence operation of another device, which violates security boundaries.

A solution to that problem is to implement a third (trusted) component that gets exclusive access to the shared memory page, and that drivers can access via IPC with the [Mmio\\_space](#) protocol. This proxy-component can then enforce an access policy.

### Include File

```
#include <l4/re/mmio_space>
```

Definition at line 45 of file [mmio\\_space](#).

## 16.277.2 Member Enumeration Documentation

### 16.277.2.1 Access\_width

enum `L4Re::Mmio_space::Access_width`

Actual size of the value to read or write.

#### Enumerator

---

Wd_8bit	Value is a byte.
Wd_16bit	Value is a 2-byte word.
Wd_32bit	Value is a 4-byte word.
Wd_64bit	Value is a 8-byte word.

Definition at line 49 of file [mmio\\_space](#).

## 16.277.3 Member Function Documentation

### 16.277.3.1 mmio\_read()

```
long L4Re::Mmio_space::mmio_read (
    Addr addr,
    char width,
    l4_uint64_t * value)
```

Read a value from the given address.

#### Parameters

	<i>addr</i>	Device virtual address to read from. The address must be aligned relative to the access width.
	<i>width</i>	Access width of value to be read, see <a href="#">Access_width</a> .
out	<i>value</i>	Return value. If width is smaller than 64 bit, the upper bits are guaranteed to be 0.

#### Return values

<a href="#">L4_EOK</a>	Success.
-L4_EPERM	Insufficient read rights.
-L4_EINVAL	Address does not exist or cannot be accessed with the given width.

References [mmio\\_read\(\)](#).

Referenced by [mmio\\_read\(\)](#).

Here is the caller graph for this function:

### 16.277.3.2 mmio\_write()

```
long L4Re::Mmio_space::mmio_write (  
    Addr addr,  
    char width,  
    l4_uint64_t value)
```

Write a value to the given address.

#### Parameters

<i>addr</i>	Device virtual address to write to. The address must be aligned relative to the access width.
<i>width</i>	Access width of value to write, see <a href="#">Access_width</a> .
<i>value</i>	Value to write. If width is smaller than 64 bit, the upper bits are ignored.

#### Return values

<a href="#">L4_EOK</a>	Success.
<code>-L4_EPERM</code>	Insufficient write rights.
<code>-L4_EINVAL</code>	Address does not exist or cannot be accessed with the given width.

## 16.278.1 Detailed Description

Name-space interface.

All name space objects must provide this interface. However, it is not mandatory that a name space object allows to register new capabilities.

The name lookup is done iteratively, this means the hierarchical names are resolved component wise by the client itself.

Definition at line 49 of file [namespace](#).

## 16.278.2 Member Enumeration Documentation

### 16.278.2.1 Query\_result\_flags

```
enum L4Re::Namespace::Query_result_flags
```

Flags returned by query IPC, only used internally.

#### Enumerator

Partly_resolved	Name was only partly resolved.
-----------------	--------------------------------

Definition at line 77 of file [namespace](#).

### 16.278.2.2 Query\_timeout

```
enum L4Re::Namespace::Query_timeout
```

Timeout values for query operation.

#### Enumerator

To_default	Default timeout.
To_non_blocking	Expect callee to answer immediately.

Definition at line 83 of file [namespace](#).

### 16.278.2.3 Register\_flags

```
enum L4Re::Namespace::Register_flags
```

Flags for registering name spaces.

#### Enumerator

---

Ro	Read-only.
Rw	Read-write.
Rs	Read-only + strong.
Rws	Read-write + strong.
Strong	Strong.
Trusted	Obsolete, do not use.
Link	Obsolete, do not use.
Overwrite	If entry already exists, overwrite it.

Definition at line 57 of file [namespace](#).

## 16.278.3 Member Function Documentation

### 16.278.3.1 `query()` [1/2]

```
long L4Re::Namespace::query (
    char const * name,
    L4::Cap< void > const & cap,
    int timeout = To_default,
    l4_umword_t * local_id = 0,
    bool iterate = true) const [noexcept]
```

Query the name space for a named object.

#### Parameters

in	<i>name</i>	String to query (without any leading slashes).
out	<i>cap</i>	Capability slot where the received capability will be put.
in	<i>timeout</i>	Timeout of query in milliseconds. The client will only wait if a name has already been registered with the server but no object has yet been attached.
out	<i>local_id</i>	If given, <a href="#">L4_RCV_ITEM_LOCAL_ID</a> will be set for the IPC from the name space, so that if the capability that was received is a local item, the capability ID will be returned with this parameter.
in	<i>iterate</i>	If true, the client will try to resolve names by iteratively calling the name spaces until the name is fully resolved.

#### Return values

<i>0</i>	Name could be fully resolved.
<i>&gt;0</i>	Name could only be partly resolved. The number of remaining characters is returned.
<i>-L4_ENOENT</i>	Entry could not be found.
<i>-L4_EAGAIN</i>	Entry exists but no object is yet attached. Try again later.
<i>&lt;0</i>	IPC errors, see <a href="#">l4_error_code_t</a> .

Definition at line 114 of file [namespace\\_impl.h](#).

### 16.278.3.2 `query()` [2/2]

```

long L4Re::Namespace::query (
    char const * name,
    unsigned len,
    L4::Cap< void > const & cap,
    int timeout = To_default,
    l4_umword_t * local_id = 0,
    bool iterate = true) const [noexcept]
  
```

Query the name space for a named object.

The query string does not necessarily need to be null-terminated.

#### Parameters

in	<i>len</i>	Length of the string to query without any terminating null characters.
in	<i>name</i>	String to query (without any leading slashes).
out	<i>cap</i>	Capability slot where the received capability will be put.

in	<i>timeout</i>	Timeout of query in milliseconds. The client will only wait if a name has already been registered with the server but no object has yet been attached.
out	<i>local_id</i>	If given, <a href="#">L4_RCV_ITEM_LOCAL_ID</a> will be set for the IPC from the name space, so that if the capability that was received is a local item, the capability ID will be returned with this parameter.
in	<i>iterate</i>	If true, the client will try to resolve names by iteratively calling the name spaces until the name is fully resolved.

### Return values

0	Name could be fully resolved.
>0	Name could only be partly resolved. The number of remaining characters is returned.
-L4_ENOENT	Entry could not be found.
-L4_EAGAIN	Entry exists but no object is yet attached. Try again later.
<0	IPC errors, see <a href="#">l4_error_code_t</a> .

Definition at line 66 of file [namespace\\_impl.h](#).

### 16.278.3.3 register\_obj()

```

long L4Re::Namespace::register_obj (
    char const * name,
    L4::Ipc::Cap< void > obj,
    unsigned flags = Rw) const [inline], [noexcept]
  
```

Register an object with a name.

### Parameters

<i>name</i>	Name under which the object should be registered.
<i>obj</i>	Capability to object to register. An invalid capability may be given to only reserve the name for later use.

<i>flags</i>	Flags to assign to the entry, see <a href="#">L4Re::Namespace::Register_flags</a> . Note that the rights that are assigned to a capability are not only determined by the rights given in these flags but also by the rights with which the <code>obj</code> capability was mapped to the name space.
--------------	---

### Return values

<i>0</i>	Object was successfully registered with <i>name</i> .
<i>-L4_EEXIST</i>	Name already registered.
<i>-L4_EPERM</i>	Insufficient permissions; see precondition.
<i>-L4_ENOMEM</i>	Server has insufficient resources.
<i>-L4_EINVAL</i>	Invalid parameter.
<i>&lt;0</i>	IPC errors, see <a href="#">l4_error_code_t</a> .

### Precondition

The invoked [Namespace](#) capability must have the permission [L4\\_CAP\\_FPAGE\\_W](#).

Definition at line 165 of file [namespace](#).

References [L4::Kobject\\_t< Namespace, L4::Kobject, L4RE\\_PROTO\\_NAMESPACE, L4::Type\\_info::Demand\\_t< 1 > >::c\(\)](#), [register\\_obj\(\)](#), and [Rw](#).

### 16.278.3.4 unlink()

```
long L4Re::Namespace::unlink (
    char const * name) [inline]
```

Remove an entry from the name space.

#### Parameters

<i>name</i>	Name of the entry to remove.
-------------	------------------------------

#### Return values

0	Entry successfully removed.
-L4_ENOENT	Given name does not exist.
-L4_EPERM	Insufficient permissions; see precondition.
-L4_EACCESS	Name cannot be removed.
<0	IPC errors, see <a href="#">l4_error_code_t</a> .

#### Precondition

The invoked [Namespace](#) capability must have the permission [L4\\_CAP\\_FPAGE\\_W](#).

Definition at line 191 of file [namespace](#).

## 16.279 L4Re::Ned::Cmd\_control Class Reference

Direct control interface for Ned.

```
#include <cmd_control>
```

Collaboration diagram for L4Re::Ned::Cmd\_control:

### Public Member Functions

- long [execute](#) (L4::lpc::String<> cmd) noexcept  
*Execute the given Lua code.*
- long [execute](#) (L4::lpc::String<> cmd, L4::lpc::String< char > \*result) noexcept  
*Execute the given Lua code.*

### 16.279.1 Detailed Description

Direct control interface for Ned.

Definition at line 19 of file [cmd\\_control](#).

### 16.279.2 Member Function Documentation

#### 16.279.2.1 execute() [1/2]

```
long L4Re::Ned::Cmd_control::execute (
    L4::lpc::String<> cmd) [inline], [noexcept]
```

Execute the given Lua code.

#### Parameters

---

in	<i>cmd</i>	String with Lua code to execute.
----	------------	----------------------------------

### Return values

<i>L4_EOK</i>	Code was successfully executed.
<i>-L4_EINVAL</i>	Code could not be parsed.
<i>-L4_EIO</i>	Error during code execution.

The code is executed using the global Lua state of ned which is retained between successive calls to execute. Thus you may define data in one call to execute and use it in a subsequent call.

This function does not return any results from the execution of the Lua code itself.

Definition at line 42 of file [cmd\\_control](#).

*Helper to check for protocol conflicts.*

### 16.280.1 Detailed Description

[Parent](#) interface.

See also

[Parent API](#) for more details about the purpose.

Definition at line 42 of file [parent](#).

### 16.280.2 Member Function Documentation

#### 16.280.2.1 [signal\(\)](#)

```
long L4Re::Parent::signal (
    unsigned long sig,
    unsigned long val)
```

Send a signal to the parent.

#### Parameters

<i>sig</i>	Signal to send
<i>val</i>	Value of the signal

#### Return values

---

0	Success
<0	IPC error

#### Note

The implementations of this interface in Moe and Ned only recognize the signal 0, in which case they will terminate the application from which the interface was invoked and not return. In this case, `val` is treated as the application's return code. For any other value of `sig`, the method just returns successfully.

- static void **\_\_check\_protocols\_\_ ()** noexcept

*Helper to check for protocol conflicts.***16.281.1 Detailed Description**

Low-bandwidth interface for random number generators.

The interface offers an ICU interface where a client can register an interrupt to get notified when entropy is available. Support for notifications is optional. If a service does not implement notification, it must return 0 for the number of interrupts in the [info\(\)](#) call. The notification interrupt must have index 0.

**Include File**

```
#include <l4/re/random>
```

Definition at line 33 of file [random](#).

**16.281.2 Member Function Documentation****16.281.2.1 get\_random()**

```
long L4Re::Random::get_random (
    l4_size_t size,
    L4::Ipc::Array< char, unsigned long > * buffer)
```

Get a random number.

**Parameters**

	<i>size</i>	Number of bytes of entropy requested.
out	<i>buffer</i>	<a href="#">Buffer</a> containing the random number. Each byte in the buffer contains 8 bits of randomness.

**Return values**

$\geq 0$	Actual size of the returned random number in bytes. This may be less than the requested size. The return value may also be 0 if temporarily no entropy is available.
<code>-L4_EIO</code>	Source of randomness permanently unavailable.
$< 0$	IPC error.

This function should never block. It should immediately return as much entropy as is available. If the call returns less than the requested bytes and a notification interrupt was installed, then the service triggers an interrupt as soon as the remaining entropy is available. That means that when an interrupt is triggered, the service must guarantee that the next call to [get\\_random\(\)](#) returns at least the number of missing bytes for the call that initially triggered the notification.

If [get\\_random\(\)](#) is called while a notification is pending, then the behaviour is implementation-defined.

The documentation for this struct was generated from the following file:

## 16.282.3 Member Function Documentation

### 16.282.3.1 attach() [1/2]

```
long L4Re::Rm::attach (
    l4_addr_t * start,
    unsigned long size,
    Rm::Flags flags,
    L4::Ipc::Cap< Dataspace > mem,
    Rm::Offset offs = 0,
    unsigned char align = L4_PAGESHIFT,
    L4::Cap< L4::Task > const task = L4::Cap<L4::Task>::Invalid,
    char const * name = nullptr,
    Rm::Offset backing_offset = 0) const [noexcept]
```

Attach a data space to a region.

#### Parameters

in, out	<i>start</i>	Virtual start address where the region manager shall attach the data space. Will be rounded down to the nearest start of a page. If <a href="#">L4Re::Rm::F::Search_addr</a> is given this value is used as the start address to search for a free virtual memory region and the resulting address is returned here. If <a href="#">L4Re::Rm::F::In_area</a> is given the value is used as a selector for the area (see <a href="#">L4Re::Rm::reserve_area</a> ) to attach the data space to.
	<i>size</i>	Size of the data space to attach (in bytes). Will be rounded up to the nearest multiple of the page size.

	<i>flags</i>	The flags control how and with which rights the dataspace is attached to the region. See <a href="#">L4Re::Rm::F::Attach_flags</a> and <a href="#">L4Re::Rm::F::Region_flags</a> . The caller must specify the desired rights of the attached region explicitly. The default set of rights is empty. If the <a href="#">F::Eager_map</a> flag is set this function may also return <a href="#">L4Re::Dataspace::map</a> error codes if the mapping fails.
	<i>mem</i>	Data space.
	<i>offs</i>	Offset into the data space to use.
	<i>align</i>	Alignment of the virtual region, log2-size, default: a page ( <a href="#">L4_PAGESHIFT</a> ). This is only meaningful if the <a href="#">L4Re::Rm::F::Search_addr</a> flag is used.
	<i>task</i>	Optional destination task of mapping if <a href="#">F::Eager_map</a> flag was passed. If invalid, the mapping is established in the current task. This parameter is only useful if the region manager is for a foreign task.
	<i>name</i>	Optional name of the region.
	<i>backing_offset</i>	Optional value describing an offset into the backing store of this region.

### Return values

0	Success
-L4_ENOENT	No area could be found (see <a href="#">L4Re::Rm::F::In_area</a> )
-L4_EPERM	Operation not allowed.
-L4_EINVAL	
-L4_EADDRNOTAVAIL	The given address is not available.
<0	IPC errors

Makes the whole or parts of a data space visible in the virtual memory of the corresponding task. The corresponding region in the virtual address space is backed with the contents of the dataspace.

### Note

When searching for a free place in the virtual address space, the space between *start* and the end of the virtual address space is searched.

There is no region object created, instead the region is defined by a virtual address within this range (see [L4Re::Rm::find](#)).

Definition at line 34 of file [rm\\_impl.h](#).

References [L4::Kobject\\_t< Rm, L4::Pager, L4RE\\_PROTO\\_RM, L4::Type\\_info::Demand\\_t< 1 > >::c\(\)](#), [L4Re::Rm::F::Eager\\_map](#), [L4Re::Rm::F::Kernel](#), [L4Re::Rm::F::No\\_eager\\_map](#), [L4Re::Rm::F::Reserved](#), and [L4Re::Rm::F::Rights\\_mask](#).

### 16.282.3.2 attach() [2/2]

```

template<typename T>
long L4Re::Rm::attach (
    T ** start,
    unsigned long size,
    Flags flags,
    L4::Ipc::Cap< Dataspace > mem,
    Offset offs = 0,
    unsigned char align = L4_PAGESHIFT,
    L4::Cap< L4::Task > const task = L4::Cap<L4::Task>::Invalid,
    char const * name = nullptr,
    Offset backing_offset = 0) const [inline], [noexcept]

```

Attach a data space to a region.

#### Parameters

in, out	<i>start</i>	Virtual start address where the region manager shall attach the data space. Will be rounded down to the nearest start of a page. If <a href="#">L4Re::Rm::F::Search_addr</a> is given this value is used as the start address to search for a free virtual memory region and the resulting address is returned here. If <a href="#">L4Re::Rm::F::In_area</a> is given the value is used as a selector for the area (see <a href="#">L4Re::Rm::reserve_area</a> ) to attach the data space to.
	<i>size</i>	Size of the data space to attach (in bytes). Will be rounded up to the nearest multiple of the page size.
	<i>flags</i>	The flags control how and with which rights the dataspace is attached to the region. See <a href="#">L4Re::Rm::F::Attach_flags</a> and <a href="#">L4Re::Rm::F::Region_flags</a> . The caller must specify the desired rights of the attached region explicitly. The default set of rights is empty. If the <a href="#">F::Eager_map</a> flag is set this function may also return <a href="#">L4Re::Dataspace::map</a> error codes if the mapping fails.
	<i>mem</i>	Data space.
	<i>offs</i>	Offset into the data space to use.
	<i>align</i>	Alignment of the virtual region, log2-size, default: a page ( <a href="#">L4_PAGESHIFT</a> ). This is only meaningful if the <a href="#">L4Re::Rm::F::Search_addr</a> flag is used.

	<i>task</i>	Optional destination task of mapping if <code>F::Eager_map</code> flag was passed. If invalid, the mapping is established in the current task. This parameter is only useful if the region manager is for a foreign task.
	<i>name</i>	Optional name of the region.
	<i>backing_offset</i>	Optional value describing an offset into the backing store of this region.

### Return values

0	Success
-L4_ENOENT	No area could be found (see <a href="#">L4Re::Rm::F::In_area</a> )
-L4_EPERM	Operation not allowed.
-L4_EINVAL	
-L4_EADDRNOTAVAIL	The given address is not available.
<0	IPC errors

Makes the whole or parts of a data space visible in the virtual memory of the corresponding task. The corresponding region in the virtual address space is backed with the contents of the dataspace.

### Note

When searching for a free place in the virtual address space, the space between *start* and the end of the virtual address space is searched.

There is no region object created, instead the region is defined by a virtual address within this range (see [L4Re::Rm::find](#)).

### 16.282.3.3 detach() [1/3]

```

int L4Re::Rm::detach (
    l4_addr_t addr,
    L4::Cap< Dataspace > * mem,
    L4::Cap< L4::Task > const & task = This_task) const [inline], [noexcept]

```

Detach and unmap a region from the address space.

### Parameters

	<i>addr</i>	Virtual address of region, any address within the region is valid.
out	<i>mem</i>	<a href="#">Dataspace</a> that is affected. Give 0 if not interested.
	<i>task</i>	This argument specifies the task where the pages are unmapped. Provide <a href="#">L4::Cap&lt;L4::Task&gt;::Invalid</a> for none. The default is the current task.

### Return values

<a href="#">L4Re::Rm::Detach_result</a>	On success.
<a href="#">-L4_ENOENT</a>	No region found.
<a href="#">&lt;0</a>	IPC errors

Frees a region in the virtual address space given by *addr* (address type). The corresponding part of the address space is now available again.

Definition at line [765](#) of file [rm](#).

References [detach\(\)](#), and [Detach\\_overlap](#).

## 16.282.3.4 detach() [2/3]

```
int L4Re::Rm::detach (
    l4_addr_t start,
    unsigned long size,
    L4::Cap< Dataspace > * mem,
    L4::Cap< L4::Task > const & task) const [inline], [noexcept]
```

Detach and unmap all parts of the regions within the specified interval.

## Parameters

	<i>start</i>	Start of area to detach, must be within region.
	<i>size</i>	Size of of area to detach (in bytes).
out	<i>mem</i>	<a href="#">Dataspace</a> that is affected. Give 0 if not interested.
	<i>task</i>	This argument specifies the task where the pages are unmapped. Provide <a href="#">L4::Cap&lt;L4::Task&gt;::Invalid</a> for none. The default is the current task.

## Return values

<a href="#">L4Re::Rm::Detach_result</a>	On success.
<code>-L4_ENOENT</code>	No region found.
<code>&lt;0</code>	IPC errors

Frees all regions within the interval given by start and size. If a region overlaps the start or the end of the interval this region is only detached partly. If the interval is within one region the original region is split up into two separate regions.

Definition at line 778 of file [rm](#).

References [detach\(\)](#), and [Detach\\_exact](#).

Here is the call graph for this function:

**16.282.3.5 detach()** [3/3]

```
int L4Re::Rm::detach (
    void * addr,
    L4::Cap< Dataspace > * mem,
    L4::Cap< L4::Task > const & task = This_task) const [inline], [noexcept]
```

Detach and unmap a region from the address space.

**Parameters**

---

	<i>addr</i>	Virtual address of region, any address within the region is valid.
out	<i>mem</i>	<a href="#">Dataspace</a> that is affected. Give 0 if not interested.
	<i>task</i>	This argument specifies the task where the pages are unmapped. Provide <a href="#">L4::Cap&lt;L4::Task&gt;::Invalid</a> for none. The default is the current task.

### Return values

<a href="#">L4Re::Rm::Detach_result</a>	On success.
<code>-L4_ENOENT</code>	No region found.
<code>&lt;0</code>	IPC errors

Frees a region in the virtual address space given by *addr* (address type). The corresponding part of the address space is now available again.

Definition at line 770 of file [rm](#).

References [detach\(\)](#), and [Detach\\_overlap](#).

Here is the call graph for this function:

### 16.282.3.6 find()

```

long L4Re::Rm::find (
    l4\_addr\_t * addr,
    unsigned long * size,
    Offset * offset,
    L4Re::Rm::Flags * flags,
    L4::Cap< Dataspace > * m) [inline], [noexcept]
  
```

Find a region given an address and size.

### Parameters

in, out	<i>addr</i>	Address to look for. Returns the start address of the found region.
in, out	<i>size</i>	Size of the area to look for (in bytes). Returns the size of the found region (in bytes).
out	<i>offset</i>	Offset at the beginning of the region within the associated dataspace.

out	<i>flags</i>	Region flags, see <a href="#">F::Region_flags</a> (and <a href="#">F::ln_area</a> ).
out	<i>m</i>	Associated dataspace or paging service.

### Return values

0	Success
-L4_EPERM	Operation not allowed.
-L4_ENOENT	No region found.
<0	IPC errors

This function returns the properties of the region that contains the area described by the `addr` and `size` parameter. If no such region is found but a reserved area, the area is returned and [F::ln\\_area](#) is set in `flags`. Note, in the case of an area the `offset` and `m` return values are invalid.

### Note

The value of the `size` input parameter should be 1 to assure that a region can be determined unambiguously.

Definition at line 672 of file [rm](#).

References [L4::Kobject\\_t< Rm, L4::Pager, L4RE\\_PROTO\\_RM, L4::Type\\_info::Demand\\_t< 1 > >::c\(\)](#).

Here is the call graph for this function:

### 16.282.3.7 free\_area()

```
long L4Re::Rm::free_area (  
    l4_addr_t addr)
```

Free an area from the region map.

#### Parameters

---

<i>addr</i>	An address within the area to free.
-------------	-------------------------------------

### Return values

0	Success
-L4_ENOENT	No area found.
<0	IPC errors

### Note

The data spaces that are attached to that area are not detached by this operation.

### See also

[reserve\\_area\(\)](#) for more information about areas.

### 16.282.3.8 get\_areas()

```
long L4Re::Rm::get_areas (
    l4_addr_t start,
    L4::Ipc::Ret_array< Area > areas)
```

Return the list of areas whose starting addresses are higher or equal to `start` in the address space managed by this region map.

#### Parameters

---

	<i>start</i>	Virtual address from where to start searching.
out	<i>areas</i>	List of areas found in this region map.

### Return values

$\geq 0$	Number of returned areas in the <i>areas</i> array.
$< 0$	IPC errors

### Note

The returned list of areas might not be complete and the caller shall use the function repeatedly with a start address one larger than the end address of the last area from the previous call.

### 16.282.3.9 get\_info()

```

long L4Re::Rm::get_info (
    l4_addr_t addr,
    L4::Ipc::String< char > & name,
    Offset & backing_offset)
  
```

Return auxiliary information of a region.

This is a debugging feature and might not be available.

### Parameters

	<i>addr</i>	Virtual address of the region.
out	<i>name</i>	Name of the region.
out	<i>backing_offset</i>	Backing offset information.

### Return values

0	Success
-L4_ENOENT	<a href="#">Region</a> not found.
-L4_ENOSYS	Function not available.
<0	IPC errors

References [detach\(\)](#).

Referenced by [get\\_areas\(\)](#).

### 16.282.3.10 get\_regions()

```

long L4Re::Rm::get_regions (
    l4_addr_t start,
    L4::Ipc::Ret_array< Region > regions)
  
```

Return the list of regions whose starting addresses are higher or equal to `start` in the address space managed by this region map.

### Parameters

	<i>start</i>	Virtual address from where to start searching.
out	<i>regions</i>	List of regions found in this region map.

### Return values

$\geq 0$	Number of returned regions in the <code>regions</code> array.
$< 0$	IPC errors

### Note

The returned list of regions might not be complete and the caller shall use the function repeatedly with a start address one larger than the end address of the last region from the previous call.

Here is the caller graph for this function:

### 16.282.3.11 `reserve_area()` [1/2]

```

long L4Re::Rm::reserve_area (
    14_addr_t * start,
    unsigned long size,

```

```
Flags flags = Flags(0),  
unsigned char align = L4_PAGESHIFT) const [inline], [noexcept]
```

Reserve the given area in the region map.

#### Parameters

---

<i>in, out</i>	<i>start</i>	The virtual start address of the area to reserve. Returns the start address of the area.
	<i>size</i>	The size of the area to reserve (in bytes).
	<i>flags</i>	Flags for the reserved area (see <a href="#">L4Re::Rm::F::Region_flags</a> and <a href="#">L4Re::Rm::F::Attach_flags</a> ).
	<i>align</i>	Alignment of area if searched as bits (log2 value).

### Return values

<i>0</i>	Success
<i>-L4_EADDRNOTAVAIL</i>	The given area cannot be reserved.
<i>&lt;0</i>	IPC errors

This function reserves an area within the virtual address space managed by the region map. There are two kinds of areas available:

- Reserved areas (*flags* = [L4Re::Rm::F::Reserved](#)), where no data spaces can be attached
- Special purpose areas (*flags* = 0), where data spaces can be attached to the area via the [L4Re::Rm::F::In\\_area](#) flag and a start address within the area itself.

### Note

When searching for a free place in the virtual address space (with *flags* = [L4Re::Rm::F::Search\\_addr](#)), the space between *start* and the end of the virtual address space is searched.

Definition at line [280](#) of file [rm](#).

Here is the call graph for this function:

**16.282.3.12 reserve\_area()** [2/2]

```
template<typename T>
long L4Re::Rm::reserve_area (
    T ** start,
    unsigned long size,
    Flags flags = Flags(0),
    unsigned char align = L4_PAGESHIFT) const [inline], [noexcept]
```

Reserve the given area in the region map.

**Parameters**

---

<i>in, out</i>	<i>start</i>	The virtual start address of the area to reserve. Returns the start address of the area.
	<i>size</i>	The size of the area to reserve (in bytes).
	<i>flags</i>	Flags for the reserved area (see <a href="#">F::Region_flags</a> and <a href="#">F::Attach_flags</a> ).
	<i>align</i>	Alignment of area if searched as bits (log2 value).

### Return values

0	Success
-L4_EADDRNOTAVAIL	The given area cannot be reserved.
<0	IPC errors

For more information, please refer to the analogous function

### 16.284.2 Member Enumeration Documentation

#### 16.284.2.1 [Attach\\_flags](#)

```
enum L4Re::Rm::F::Attach_flags : l4_uint32_t
```

Flags for attach operation.

#### Enumerator

<a href="#">Search_addr</a>	Search for a suitable address range.
<a href="#">In_area</a>	Search only in area, or map into area.
<a href="#">Eager_map</a>	Eagerly map the attached data space in.
<a href="#">No_eager_map</a>	Prevent eager mapping of the attached data space.
<a href="#">Attach_mask</a>	Mask of all attach flags.

Definition at line 111 of file [rm](#).

#### 16.284.2.2 [Region\\_flags](#)

```
enum L4Re::Rm::F::Region_flags : l4_uint16_t
```

[Region](#) flags (permissions, cacheability, special).

#### Enumerator

Rights_mask	<a href="#">Region</a> rights.
R	Readable region.
W	Writable region.
X	Executable region.
RW	Readable and writable region.
RX	Readable and executable region.
RWX	Readable, writable and executable region.
Kernel	Kernel-provided memory (KUMEM).
Detach_free	Free the portion of the data space after detach.
Pager	<a href="#">Region</a> has a pager.
Reserved	<a href="#">Region</a> is reserved (blocked).
Caching_mask	Mask of all <a href="#">Rm</a> cache bits.
Cache_normal	Cache bits for normal cacheable memory. This is the default if no other cache-related flag was specified.
Cache_buffered	Cache bits for buffered (write combining) memory.
Cache_uncached	Cache bits for uncached memory.
Ds_map_mask	Mask for all bits for cache options and rights.
Region_flags_mask	Mask of all region flags.

Definition at line 128 of file [rm](#).

### 16.286.1 Detailed Description

```
template<typename T>
class L4Re::Rm::Unique_region< T >
```

Unique region.

Capture a single region with automatic detach on destruction and unique ownership. Stores the start address and the region-mapper capability internally. A unique region is valid precisely if the internal region-mapper capability is valid. The features for unique ownership and automatic detach are only active for valid unique regions.

Definition at line [435](#) of file [rm](#).

### 16.286.2 Constructor & Destructor Documentation

#### 16.286.2.1 Unique\_region() [1/3]

```
template<typename T>
L4Re::Rm::Unique_region< T >::Unique_region (
    T addr) [inline], [explicit], [noexcept]
```

Construct a [Unique\\_region](#) from an address.

No region manager is set.

#### Parameters

<i>addr</i>	The new address
-------------	-----------------

Definition at line [456](#) of file [rm](#).

#### 16.286.2.2 Unique\_region() [2/3]

```
template<typename T>
L4Re::Rm::Unique_region< T >::Unique_region (
    T addr,
    L4::Cap< Rm > const & rm) [inline], [noexcept]
```

Construct a valid [Unique\\_region](#) from an address and a region manager.

#### Parameters

<i>addr</i>	The address
<i>rm</i>	The region manager

Definition at line 465 of file [rm](#).

### 16.286.2.3 Unique\_region() [3/3]

```
template<typename T>
L4Re::Rm::Unique_region< T >::Unique_region (
    Unique_region< T > && o) [inline], [noexcept]
```

Move-Construct a [Unique\\_region](#).

#### Parameters

<i>o</i>	L-value reference to other region.
----------	------------------------------------

Definition at line 473 of file [rm](#).

### 16.286.2.4 ~Unique\_region()

```
template<typename T>
L4Re::Rm::Unique_region< T >::~~Unique_region () [inline], [noexcept]
```

Destructor.

If the region is valid, call [detach](#).

Definition at line 498 of file [rm](#).

## 16.286.3 Member Function Documentation

### 16.286.3.1 get()

```
template<typename T>
T L4Re::Rm::Unique_region< T >::get () const [inline], [noexcept]
```

Return the address.

**Returns**

the address

Definition at line 509 of file [rm](#).

Referenced by [L4Re::Util::Event\\_t< Default\\_event\\_payload >::init\(\)](#), and [L4Re::Util::Event\\_t< Default\\_event\\_payload >::init\\_poll\(\)](#).

Here is the caller graph for this function:

**16.286.3.2 is\_valid()**

```
template<typename T>
bool L4Re::Rm::Unique_region< T >::is_valid () const [inline], [noexcept]
```

Check if the [Unique\\_region](#) is valid.

**Returns**

true iff the [Unique\\_region](#) is valid

Definition at line 549 of file [rm](#).

**16.286.3.3 operator=()**

```
template<typename T>
Unique_region & L4Re::Rm::Unique_region< T >::operator= (
    Unique_region< T > && o) [inline], [noexcept]
```

Move-assign a [Unique\\_region](#).

**Parameters**

<i>o</i>	L-value reference to region to assign from
----------	--

Definition at line 481 of file [rm](#).

**16.286.3.4 release()**

```
template<typename T>
T L4Re::Rm::Unique_region< T >::release () [inline], [noexcept]
```

Return the address and invalidate the [Unique\\_region](#).

**Returns**

the address

Definition at line 517 of file [rm](#).

**16.286.3.5 reset()**

```
template<typename T>
void L4Re::Rm::Unique_region< T >::reset (
    T addr,
    L4::Cap< Rm > const & rm) [inline], [noexcept]
```

Set new address and region manager.

**Parameters**

<i>addr</i>	The new address
<i>rm</i>	The new region manager

Definition at line 529 of file [rm](#).

The documentation for this class was generated from the following file:

- [l4/re/rm](#)

## 16.287 L4Re::Smart\_cap\_auto< Unmap\_flags > Class Template Reference

*Pointer to the buffer storing the bits.*

## 16.290.1 Detailed Description

```
template<int BITS>
class L4Re::Util::Bitmap< BITS >
```

A static bitmap.

### Template Parameters

<i>BITS</i>	The number of bits that shall be in the bitmap.
-------------	---

Definition at line 220 of file [bitmap](#).

## 16.290.2 Member Function Documentation

### 16.290.2.1 `scan_zero()`

```
template<int BITS>
long cxx::Bitmap< BITS >::scan_zero (
    long start_bit = 0) const [inline], [noexcept]
```

Scan for the first zero bit.

#### Parameters

<i>start_bit</i>	Hint at the number of the first bit to look at. Zero bits below <i>start_bit</i> may or may not be taken into account by the implementation.
------------------	--

#### Return values

<code>&gt;=</code>	0 Number of first zero bit found.
<code>-1</code>	All bits at <i>start_bit</i> or higher are set.

Compared to [Bitmap\\_base::scan\\_zero\(\)](#), the upper bound is set to BITS.

Definition at line 365 of file [bitmap](#).

*Get the lvalue for the bit at index `bit`.*
- long `scan_zero` (long `max_bit`, long `start_bit`=0) const noexcept  
*Scan for the first zero bit.*

### Static Public Member Functions

- static long `words` (long bits) noexcept  
*Get the number of `Words` that are used for the bitmap.*
- static long `chars` (long bits) noexcept  
*Get the number of chars that are used for the bitmap.*

### Protected Types

- enum { `W_bits` = sizeof(word\_type) \* 8 , `C_bits` = 8 }
- typedef unsigned long `word_type`  
*Data type for each element of the bit buffer.*

### Static Protected Member Functions

- static unsigned `word_index` (unsigned `bit`)  
*Get the word index for the given bit.*
- static unsigned `bit_index` (unsigned `bit`)  
*Get the bit index within `word_type` for the given bit.*

### Protected Attributes

- `word_type * _bits`  
*Pointer to the buffer storing the bits.*

## 16.291.1 Detailed Description

Basic bitmap abstraction.

This abstraction keeps a pointer to a memory area that is used as bitmap.

Definition at line 18 of file `bitmap`.

## 16.291.2 Member Enumeration Documentation

### 16.291.2.1 anonymous enum

```
anonymous enum [protected]
```

#### Enumerator

---

W_bits	number of bits in <a href="#">word_type</a>
C_bits	number of bits in char

Definition at line 26 of file [bitmap](#).

## 16.291.3 Member Function Documentation

### 16.291.3.1 `atomic_clear_bit()`

```
void cxx::Bitmap_base::atomic_clear_bit (  
    long bit) [inline], [noexcept]
```

Clear bit [bit](#) atomically.

Use this function for multi-threaded access to the bitmap.

#### Parameters

<i>bit</i>	The number of the bit to clear.
------------	---------------------------------

Definition at line 269 of file [bitmap](#).

### 16.291.3.2 `atomic_get_and_clear()`

```
Bitmap_base::word_type cxx::Bitmap_base::atomic_get_and_clear (  
    long bit) [inline], [noexcept]
```

Clear bit [bit](#) atomically and return old state.

Use this function for multi-threaded access to the bitmap.

#### Parameters

<i>bit</i>	The number of the bit to clear.
------------	---------------------------------

Definition at line 279 of file [bitmap](#).

### 16.291.3.3 `atomic_get_and_set()`

```
Bitmap_base::word_type cxx::Bitmap_base::atomic_get_and_set (  
    long bit) [inline], [noexcept]
```

Set bit [bit](#) atomically and return old state.

Use this function for multi-threaded access to the bitmap.

#### Parameters

---

<i>bit</i>	The number of the bit to set.
------------	-------------------------------

Definition at line 308 of file [bitmap](#).

#### 16.291.3.4 atomic\_set\_bit()

```
void cxx::Bitmap_base::atomic_set_bit (
    long bit) [inline], [noexcept]
```

Set bit [bit](#) atomically.

Use this function for multi-threaded access to the bitmap.

##### Parameters

<i>bit</i>	The number of the bit to set.
------------	-------------------------------

Definition at line 298 of file [bitmap](#).

#### 16.291.3.5 bit() [1/2]

```
Bitmap_base::word_type cxx::Bitmap_base::bit (
    long bit) const [inline], [noexcept]
```

Get the truth value of a bit.

##### Parameters

<i>bit</i>	The number of the bit to read.
------------	--------------------------------

##### Return values

0	<a href="#">Bit</a> is not set.
!= 0	<a href="#">Bit</a> is set.

Definition at line 318 of file [bitmap](#).

#### 16.291.3.6 bit() [2/2]

```
void cxx::Bitmap_base::bit (
    long bit,
    bool on) [inline], [noexcept]
```

Set the value of bit [bit](#) to on.

##### Parameters

<i>bit</i>	The number of the bit.
<i>on</i>	The boolean value that shall be assigned to the bit.

Definition at line 251 of file [bitmap](#).

### 16.291.3.7 `bit_index()`

```
unsigned cxx::Bitmap_base::bit_index (  
    unsigned bit) [inline], [static], [protected]
```

Get the bit index within [word\\_type](#) for the given bit.

#### Parameters

<i>bit</i>	The bit index in the bitmap.
------------	------------------------------

#### Returns

the bit index within [word\\_type](#) (`bit % W_bits`).

Definition at line 53 of file [bitmap](#).

### 16.291.3.8 `clear_bit()`

```
void cxx::Bitmap_base::clear_bit (  
    long bit) [inline], [noexcept]
```

Clear bit [bit](#).

#### Parameters

<i>bit</i>	The number of the bit to clear.
------------	---------------------------------

Definition at line 260 of file [bitmap](#).

### 16.291.3.9 `operator[]()` [1/2]

```
word\_type cxx::Bitmap_base::operator[] (  
    long bit) const [inline], [noexcept]
```

Get the bit at index [bit](#).

#### Parameters

---

<i>bit</i>	The number of the bit to read.
------------	--------------------------------

#### Return values

0	Bit is not set.
!= 0	Bit is set.

Definition at line 181 of file [bitmap](#).

#### 16.291.3.10 operator[]() [2/2]

```
Bit cxx::Bitmap_base::operator[] (
    long bit) [inline], [noexcept]
```

Get the lvalue for the bit at index [bit](#).

#### Parameters

<i>bit</i>	The number.
------------	-------------

#### Returns

lvalue for [bit](#)

Definition at line 191 of file [bitmap](#).

#### 16.291.3.11 scan\_zero()

```
long cxx::Bitmap_base::scan_zero (
    long max_bit,
    long start_bit = 0) const [inline], [noexcept]
```

Scan for the first zero bit.

#### Parameters

<i>max_bit</i>	Upper bound (exclusive) for the scanning operation.
<i>start_bit</i>	Hint at the number of the first bit to look at. Zero bits below <i>start_bit</i> may or may not be taken into account by the implementation.

#### Return values

>=	0 Number of first zero bit found.
----	-----------------------------------

-1	All bits between <code>start_bit</code> and <code>max_bit</code> are set.
----	---

Definition at line 339 of file [bitmap](#).

### 16.291.3.12 `set_bit()`

```
void cxx::Bitmap_base::set_bit (
    long bit) [inline], [noexcept]
```

Set bit [bit](#).

#### Parameters

<i>bit</i>	The number of the bit to set.
------------	-------------------------------

Definition at line 289 of file [bitmap](#).

### 16.291.3.13 `word_index()`

```
unsigned cxx::Bitmap_base::word_index (
    unsigned bit) [inline], [static], [protected]
```

Get the word index for the given bit.

#### Parameters

<i>bit</i>	The index of the bit in question.
------------	-----------------------------------

#### Returns

the index in [Bitmap\\_base::\\_bits](#) for the given bit (bit / W\_bits).

Definition at line 44 of file [bitmap](#).

### 16.295.1 Detailed Description

Buffer-register (BR) manager for [L4::Server](#).

Implementation of the [L4::lpc\\_svr::Server\\_iface](#) API for managing the server-side receive buffers needed for a set of server objects running within a server.

Definition at line 25 of file [br\\_manager](#).

### 16.295.2 Member Function Documentation

#### 16.295.2.1 alloc\_buffer\_demand()

```
int L4Re::Util::Br_manager::alloc_buffer_demand (
    Demand const & demand) [inline], [override], [virtual]
```

Tells the server to allocate buffers for the given demand.

#### Parameters

---

<i>demand</i>	The total server-side demand of receive buffers needed for a given interface, see <a href="#">Demand</a> .
---------------	--

This function is not called by user applications directly. Usually the server implementation or the registry implementation calls this function whenever a new object is registered at the server.

Implements [L4::lpc\\_svr::Server\\_iface](#).

Definition at line 54 of file [br\\_manager](#).

References [L4::Cap\\_base::cap\(\)](#), [L4Re::Util::cap\\_alloc](#), [L4::Type\\_info::Demand::caps](#), [L4\\_EINVAL](#), [L4\\_ENOMEM](#), [L4\\_EOK](#), [L4\\_ERANGE](#), [L4::Type\\_info::Demand::mem](#), and [L4::Type\\_info::Demand::ports](#).

Here is the call graph for this function:

### 16.295.2.2 get\_rcv\_cap()

```
L4::Cap< void > L4Re::Util::Br_manager::get_rcv_cap (
    int index) const [inline], [override], [virtual]
```

Get capability slot allocated to the given receive buffer.

#### Parameters

<i>index</i>	The receive buffer index of the expected capability argument ( $0 \leq \text{index} < \text{caps}$ registered with <a href="#">alloc_buffer_demand()</a> ).
--------------	---

#### Precondition

$0 \leq \text{index} < \text{caps}$  registered with [alloc\\_buffer\\_demand\(\)](#)

#### Returns

Capability slot currently allocated to the given receive buffer.

Implements [L4::lpc\\_svr::Server\\_iface](#).

Definition at line 86 of file [br\\_manager](#).

References [L4::Cap\\_base::Invalid](#), and [L4\\_CAP\\_MASK](#).

### 16.295.2.3 realloc\_rcv\_cap()

```
int L4Re::Util::Br_manager::realloc_rcv_cap (
    int index) [inline], [override], [virtual]
```

Allocate a new capability for the given receive buffer.

#### Parameters

<i>index</i>	The receive buffer index of the expected capability argument ( $0 \leq \text{index} < \text{caps}$ registered with <a href="#">alloc_buffer_demand()</a> ).
--------------	---

**Precondition**

$0 \leq \text{index} < \text{caps}$  registered with [alloc\\_buffer\\_demand\(\)](#)

**Returns**

0 on success, < 0 on error.

Implements [L4::lpc\\_svr::Server\\_iface](#).

Definition at line 94 of file [br\\_manager](#).

References [L4::Cap\\_base::cap\(\)](#), [L4Re::Util::cap\\_alloc](#), [L4\\_EINVAL](#), [L4\\_ENOMEM](#), and [L4\\_EOK](#).

Here is the call graph for this function:

**16.295.2.4 set\_rcv\_cap\_flags()**

```
void L4Re::Util::Br_manager::set_rcv_cap_flags (
    unsigned long flags) [inline]
```

Set the receive flags for the buffers.

**Precondition**

Must be called before any handlers are registered.

**Parameters**

<i>flags</i>	New receive capability flags, see <a href="#">l4_msg_item_consts_t</a> .
--------------	--

Definition at line 118 of file [br\\_manager](#).

References [l4\\_assert](#).

The documentation for this class was generated from the following file:

## 16.299 L4Re::Util::Counter< COUNTER > Struct Template Reference

Counter for [Counting\\_cap\\_alloc](#) with variable data width.

```
#include <counting_cap_alloc>
```

Collaboration diagram for L4Re::Util::Counter< COUNTER >:

### Public Member Functions

- bool [inc](#) ()  
*Increment counter if not yet saturated.*
- Type [dec](#) ()  
*Decrement counter if not saturated.*

### 16.299.1 Detailed Description

```
template<typename COUNTER = unsigned char>
struct L4Re::Util::Counter< COUNTER >
```

Counter for [Counting\\_cap\\_alloc](#) with variable data width.

This version is not thread safe.

Definition at line 27 of file [counting\\_cap\\_alloc](#).

### 16.299.2 Member Function Documentation

#### 16.299.2.1 dec()

```
template<typename COUNTER = unsigned char>
Type L4Re::Util::Counter< COUNTER >::dec () [inline]
```

Decrement counter if not saturated.

Once the counter reached the saturated state, the counter value isn't changed.

Definition at line 67 of file [counting\\_cap\\_alloc](#).

### 16.299.2.2 inc()

```
template<typename COUNTER = unsigned char>
bool L4Re::Util::Counter< COUNTER >::inc () [inline]
```

Increment counter if not yet saturated.

Once the counter reached the saturated state, the counter value isn't changed.

#### Return values

---

<i>false</i>	The counter just went saturated after it was increased.
<i>true</i>	Either the counter was already saturated – in that case the counter value was not changed, or the counter was not saturated – in that case the counter was increased.

Definition at line 50 of file [counting\\_cap\\_alloc](#).

The documentation for this struct was generated from the following file:

- [l4/re/util/counting\\_cap\\_alloc](#)

## 16.300 L4Re::Util::Counter\_atomic< COUNTER > Struct Template Reference

Thread safe version of counter for [Counting\\_cap\\_alloc](#).

```
#include <counting_cap_alloc>
```

Collaboration diagram for L4Re::Util::Counter\_atomic< COUNTER >:

### Public Member Functions

- bool [inc](#) ()  
*Increment counter if not yet saturated.*
- Type [dec](#) ()  
*Decrement counter if not saturated.*

### 16.300.1 Detailed Description

```
template<typename COUNTER = unsigned char>
struct L4Re::Util::Counter_atomic< COUNTER >
```

Thread safe version of counter for [Counting\\_cap\\_alloc](#).

Despite using atomic instructions, this version has to make sure that capability slots are not reused too early. If the last reference is gone, the capability slot has to be unmapped. The slot must only be allocated again when the unmap has completed. This is accomplished by starting with an initial count of 2. The last reference will decrease the counter to 1. Only then, after the slot was unmapped, will the counter be set to 0. This will allow other threads to reallocate the slot.

Definition at line 98 of file [counting\\_cap\\_alloc](#).

## 16.300.2 Member Function Documentation

### 16.300.2.1 dec()

```
template<typename COUNTER = unsigned char>
Type L4Re::Util::Counter_atomic< COUNTER >::dec () [inline]
```

Decrement counter if not saturated.

Once the counter reached the saturated state, the counter value isn't changed.

Definition at line 142 of file [counting\\_cap\\_alloc](#).

### 16.300.2.2 inc()

```
template<typename COUNTER = unsigned char>
bool L4Re::Util::Counter_atomic< COUNTER >::inc () [inline]
```

Increment counter if not yet saturated.

Once the counter reached the saturated state, the counter value isn't changed.

#### Return values

<i>false</i>	The counter just went saturated after it was increased.
<i>true</i>	Either the counter was already saturated – in that case the counter value was not changed, or the counter was not saturated – in that case the counter was increased.

Definition at line 121 of file [counting\\_cap\\_alloc](#).

The documentation for this struct was generated from the following file:

*Create a new, empty allocator.*
- void [setup](#) (void \*m, long capacity, long bias, Dbg \*dbg) noexcept  
*Set up the backing memory for the allocator and the area of managed capability slots.*

## 16.301.1 Detailed Description

```
template<typename COUNTERTYPE, typename Dbg>
class L4Re::Util::Counting_cap_alloc< COUNTERTYPE, Dbg >
```

Internal reference-counting cap allocator.

This is intended for internal use only. L4Re applications should use [L4Re::Util::cap\\_alloc\(\)](#).

Allocator for capability slots that automatically frees the slot and optionally unmaps the capability when the reference count goes down to zero. Reference counting must be done manually via [take\(\)](#) and [release\(\)](#). The backing store for the reference counters must be provided in the [setup\(\)](#) method. The allocator can recognize capability slots that are not managed by itself and does nothing on such slots.

### Note

The user must ensure that the backing store is zero-initialized.

The user must ensure that the capability slots managed by this allocator are not used by a different allocator, see [setup\(\)](#).

The operations in this class are not thread-safe.

Definition at line 191 of file [counting\\_cap\\_alloc](#).

## 16.301.2 Constructor & Destructor Documentation

### 16.301.2.1 Counting\_cap\_alloc()

```
template<typename COUNTERTYPE, typename Dbg>
L4Re::Util::Counting_cap_alloc< COUNTERTYPE, Dbg >::Counting_cap_alloc () [inline], [protected],
[noexcept]
```

Create a new, empty allocator.

Needs to be initialized with [setup\(\)](#) before it can be used.

Definition at line 224 of file [counting\\_cap\\_alloc](#).

## 16.301.3 Member Function Documentation

### 16.301.3.1 alloc() [1/2]

```
template<typename COUNTERTYPE, typename Dbg>
template<typename T>
L4::Cap< T > L4Re::Util::Counting_cap_alloc< COUNTERTYPE, Dbg >::alloc () [inline], [noexcept]
```

Allocate a new capability slot.

**Returns**

The newly allocated capability slot, invalid if the allocator was exhausted.

Definition at line 282 of file [counting\\_cap\\_alloc](#).

References [alloc\(\)](#), and [L4::cap\\_cast\(\)](#).

Here is the call graph for this function:

**16.301.3.2 alloc() [2/2]**

```
template<typename COUNTERTYPE, typename Dbg>
L4::Cap< void > L4Re::Util::Counting_cap_alloc< COUNTERTYPE, Dbg >::alloc () [inline], [noexcept]
```

Allocate a new capability slot.

**Returns**

The newly allocated capability slot, invalid if the allocator was exhausted.

Definition at line 257 of file [counting\\_cap\\_alloc](#).

References [L4::Cap\\_base::Invalid](#), and [L4\\_CAP\\_SHIFT](#).

Referenced by [alloc\(\)](#).

Here is the caller graph for this function:

### 16.301.3.3 free()

```
template<typename COUNTERTYPE, typename Dbg>
bool L4Re::Util::Counting_cap_alloc< COUNTERTYPE, Dbg >::free (
    L4::Cap< void > cap,
    l4_cap_idx_t task = L4_INVALID_CAP,
    unsigned unmap_flags = L4_FP_ALL_SPACES) [inline], [noexcept]
```

Free the capability.

#### Parameters

<i>cap</i>	Capability to free.
<i>task</i>	If set, task to unmap the capability from.
<i>unmap_flags</i>	Flags for unmap, see <a href="#">l4_unmap_flags_t</a> .

#### Precondition

The capability has been allocated. Calling free twice on a capability managed by this allocator results in undefined behaviour.

#### Returns

True, if the capability was managed by this allocator.

Definition at line 321 of file [counting\\_cap\\_alloc](#).

References [l4\\_assert](#), [L4\\_FP\\_ALL\\_SPACES](#), [L4\\_INVALID\\_CAP](#), [l4\\_is\\_valid\\_cap\(\)](#), and [l4\\_task\\_unmap\(\)](#).

Here is the call graph for this function:

### 16.301.3.4 release()

```
template<typename COUNTERTYPE, typename Dbg>
bool L4Re::Util::Counting_cap_alloc< COUNTERTYPE, Dbg >::release (
    L4::Cap< void > cap,
    l4_cap_idx_t task = L4_INVALID_CAP,
    unsigned unmap_flags = L4_FP_ALL_SPACES) [inline], [noexcept]
```

Decrease the reference counter for a capability.

#### Parameters

<i>cap</i>	Capability to release.
<i>task</i>	If set, task to unmap the capability from.
<i>unmap_flags</i>	Flags for unmap, see <a href="#">l4_unmap_flags_t</a> .

#### Precondition

The capability has been allocated. Calling release on a free capability results in undefined behaviour.

#### Returns

True, if the capability was freed as a result of this operation. If false is returned the capability is either still in use or is not managed by this allocator.

Does nothing apart from returning false if the capability is not managed by this allocator.

Definition at line [359](#) of file [counting\\_cap\\_alloc](#).

References [l4\\_assert](#), [L4\\_FP\\_ALL\\_SPACES](#), [L4\\_INVALID\\_CAP](#), and [l4\\_task\\_unmap\(\)](#).

Here is the call graph for this function:

### 16.301.3.5 setup()

```

template<typename COUNTERTYPE, typename Dbg>
void L4Re::Util::Counting_cap_alloc< COUNTERTYPE, Dbg >::setup (
    void * m,
    long capacity,
    long bias,
    Dbg * dbg) [inline], [protected], [noexcept]
  
```

Set up the backing memory for the allocator and the area of managed capability slots.

#### Parameters

<i>m</i>	Pointer to backing memory.
<i>capacity</i>	Number of capabilities that can be stored.
<i>bias</i>	First capability id to use by this allocator.
<i>dbg</i>	Logger for warnings if counter got saturated.

The allocator will manage the capability slots between `bias` and `bias + capacity - 1` (inclusive). It is the responsibility of the user to ensure that these slots are not used otherwise.

Definition at line [242](#) of file [counting\\_cap\\_alloc](#).

**16.301.3.6 take()**

```
template<typename COUNTERTYPE, typename Dbg>
void L4Re::Util::Counting_cap_alloc< COUNTERTYPE, Dbg >::take (
    L4::Cap< void > cap) [inline], [noexcept]
```

Increase the reference counter for the capability.

**Parameters**

<i>cap</i>	Capability, whose reference counter should be increased.
------------	--

If the capability was still free, it will be automatically allocated. Silently does nothing if the capability is not managed by this allocator.

Definition at line 296 of file [counting\\_cap\\_alloc](#).

References [L4\\_CAP\\_SHIFT](#), and [L4\\_UNLIKELY](#).

The documentation for this class was generated from the following file:

- [l4/re/util/counting\\_cap\\_alloc](#)

**16.302 L4Re::Util::Dataspace\_svr Class Reference**

[Dataspace](#) server class.

### 16.302.1 Detailed Description

[Dataspace](#) server class.

The default implementation of the interface provides a continuous dataspace with contiguous pages.

Definition at line 29 of file [dataspace\\_svr](#).

### 16.302.2 Member Function Documentation

#### 16.302.2.1 allocate()

```
virtual long L4Re::Util::Dataspace_svr::allocate (
    l4\_addr\_t offset,
    l4\_size\_t size,
    unsigned access) [inline], [virtual], [noexcept]
```

Allocate a region within a dataspace.

#### Parameters

<i>offset</i>	Offset in the dataspace, in bytes.
<i>size</i>	Size of the range, in bytes.

<i>access</i>	Access mode with which the memory backing the dataspace region should be allocated.
---------------	---

### Return values

0	Success
<0	Error

Definition at line 224 of file [dataspace\\_svr](#).

References [L4\\_ENODEV](#).

#### 16.302.2.2 clear()

```
virtual long L4Re::Util::Dataspace_svr::clear (  
    unsigned long offs,  
    unsigned long size) const [inline], [virtual], [noexcept]
```

Clear a region in the dataspace.

### Parameters

<i>offs</i>	Start of the region
<i>size</i>	Size of the region

### Return values

0	Success
<0	Error

Definition at line 192 of file [dataspace\\_svr](#).

References [L4\\_ERANGE](#).

#### 16.302.2.3 copy()

```
virtual long L4Re::Util::Dataspace_svr::copy (  
    l4\_addr\_t dst_offs,  
    l4\_umword\_t src_id,  
    l4\_addr\_t src_offs,  
    unsigned long size) [inline], [virtual], [noexcept]
```

Copy from src dataspace to this destination dataspace.

### Parameters

---

<i>dst_offs</i>	Offset into the destination dataspace
<i>src_id</i>	Local id of the source dataspace
<i>src_offs</i>	Offset into the source dataspace
<i>size</i>	Number of bytes to copy

#### Return values

$\geq 0$	Number of bytes copied
$< 0$	An error occurred. The error code may depend on the implementation.

Definition at line 175 of file [dataspace\\_svr](#).

References [L4\\_ENODEV](#).

#### 16.302.2.4 is\_static()

```
virtual bool L4Re::Util::Dataspace_svr::is_static () const [inline], [virtual], [noexcept]
```

Return whether the dataspace is static.

#### Returns

True if dataspace is static

Definition at line 244 of file [dataspace\\_svr](#).

#### 16.302.2.5 map()

```
int L4Re::Util::Dataspace_svr::map (
    Dataspace::Offset offset,
    Dataspace::Map_addr local_addr,
    Dataspace::Flags flags,
    Dataspace::Map_addr min_addr,
    Dataspace::Map_addr max_addr,
    L4::Ipc::Snd_fpage & memory) [inline]
```

Map a region of the dataspace.

#### Parameters

	<i>offset</i>	Offset to start within data space
	<i>local_addr</i>	Local address to map to.
	<i>flags</i>	<a href="#">Dataspace</a> flags, see <a href="#">L4Re::Dataspace::F::Flags</a> .
	<i>min_addr</i>	Defines start of receive window.

	<i>max_addr</i>	Defines end of receive window.
out	<i>memory</i>	Send fpage to map

### Return values

0	Success
<0	Error

Definition at line 57 of file [dataspace\\_svr](#).

References [L4\\_EOK](#), [L4\\_ERANGE](#), [l4\\_fpage\(\)](#), [L4\\_PAGESHIFT](#), [l4\\_round\\_page\(\)](#), [l4\\_trunc\\_page\(\)](#), [l4\\_trunc\\_size\(\)](#), and [map\\_hook\(\)](#).

Here is the call graph for this function:

#### 16.302.2.6 map\_hook()

```

virtual int L4Re::Util::Dataspace_svr::map_hook (
    Dataspace::Offset offs,
    unsigned order,
    Dataspace::Flags flags,
    Dataspace::Map_addr * base,
    unsigned * send_order) [inline], [virtual]

```

A hook that is called for acquiring the data to be mapped.

### Parameters

<i>offs</i>	Offset in dataspace to supply
<i>order</i>	Log2-size of data to supply
<i>flags</i>	Flags for the mapping
<i>base</i>	Start address of the flexpage to be mapped
<i>send_order</i>	Order (log2 of size) of the flexpage to be mapped

### Return values

$< 0$	Error and the map request will be aborted with that error.
$\geq 0$	Success

### See also

[map](#)

Definition at line 136 of file [dataspace\\_svr](#).

Referenced by [map\(\)](#).

Here is the caller graph for this function:

### 16.302.2.7 map\_info()

```
virtual long L4Re::Util::Dataspace_svr::map_info (
    l4_addr_t & start_addr,
    l4_addr_t & end_addr) [inline], [virtual], [noexcept]
```

Return mapping information for no-MMU systems.

The method is only called on no-MMU systems. It should return the address of the underlying backing buffer so that the caller might map the dataspace.

The default implementation always returns an error because the derived class must provide the required information.

### See also

[L4Re::Dataspace::map\\_info\(\)](#)

Definition at line 259 of file [dataspace\\_svr](#).

References [L4\\_EPERM](#).

### 16.302.2.8 page\_shift()

```
virtual unsigned long L4Re::Util::Dataspace_svr::page_shift () const [inline], [virtual],  
[noexcept]
```

Define the size of the flexpage to map.

#### Returns

flexpage size

Definition at line 236 of file [dataspace\\_svr](#).

References [L4\\_LOG2\\_PAGESIZE](#).

### 16.302.2.9 release()

```
virtual unsigned long L4Re::Util::Dataspace_svr::release () [inline], [virtual], [noexcept]
```

Release a reference to this dataspace.

#### Returns

Number of references to the dataspace

Default does nothing and returns always zero.

Definition at line 160 of file [dataspace\\_svr](#).

### 16.302.2.10 take()

```
virtual void L4Re::Util::Dataspace_svr::take () [inline], [virtual], [noexcept]
```

Take a reference to this dataspace.

Default does nothing.

Definition at line 150 of file [dataspace\\_svr](#).

The documentation for this class was generated from the following file:

## 16.303.1 Detailed Description

template<typename PAYLOAD>  
class [L4Re::Util::Event\\_buffer\\_consumer\\_t< PAYLOAD >](#)

An event buffer consumer.

Definition at line 83 of file [event\\_buffer](#).

## 16.303.2 Member Function Documentation

### 16.303.2.1 [foreach\\_available\\_event\(\)](#)

```
template<typename PAYLOAD>
template<typename CB, typename D>
void L4Re::Util::Event\_buffer\_consumer\_t< PAYLOAD >::foreach\_available\_event (
    CB const & cb,
    D data = D()) [inline]
```

Call function on every available event.

#### Parameters

<i>cb</i>	Function callback.
<i>data</i>	Data to pass as an argument to the callback.

Definition at line 94 of file [event\\_buffer](#).

Referenced by [L4Re::Util::Event\\_buffer\\_consumer\\_t< Default\\_event\\_payload >::process\(\)](#).

Here is the caller graph for this function:

### 16.303.2.2 process()

```
template<typename PAYLOAD>
template<typename CB, typename D>
void L4Re::Util::Event_buffer_consumer_t< PAYLOAD >::process (
    L4::Cap< L4::Irq > irq,
    L4::Cap< L4::Thread > thread,
    CB const & cb,
    D data = D()) [inline]
```

Continuously wait for events and process them.

#### Parameters

<i>irq</i>	<a href="#">Event</a> signal to wait for.
<i>thread</i>	Thread capability of the thread calling this function.
<i>cb</i>	Callback function that is called for each received event.
<i>data</i>	Data to pass as an argument to the processing callback.

#### Note

This function never returns.

Definition at line 115 of file [event\\_buffer](#).

The documentation for this class was generated from the following file:

### 16.304.1 Detailed Description

```
template<typename PAYLOAD>
class L4Re::Util::Event_buffer_t< PAYLOAD >
```

Event\_buffer utility class.

Definition at line 25 of file [event\\_buffer](#).

### 16.304.2 Member Function Documentation

#### 16.304.2.1 attach()

```
template<typename PAYLOAD>
long L4Re::Util::Event_buffer_t< PAYLOAD >::attach (
    L4::Cap< L4Re::Dataspace > ds,
    L4::Cap< L4Re::Rm > rm) [inline], [noexcept]
```

Attach event buffer from address space.

#### Parameters

<i>ds</i>	<a href="#">Dataspace</a> of the event buffer.
<i>rm</i>	Region manager to attach buffer to.

#### Returns

0 on success, negative error code otherwise.

Definition at line 45 of file [event\\_buffer](#).

#### 16.304.2.2 buf()

```
template<typename PAYLOAD>
void * L4Re::Util::Event_buffer_t< PAYLOAD >::buf () const [inline], [noexcept]
```

Return the buffer.

#### Returns

Pointer to the event buffer.

Definition at line 35 of file [event\\_buffer](#).

#### 16.304.2.3 detach()

```
template<typename PAYLOAD>
long L4Re::Util::Event_buffer_t< PAYLOAD >::detach (
    L4::Cap< L4Re::Rm > rm) [inline], [noexcept]
```

Detach event buffer from address space.

#### Parameters

<i>rm</i>	Region manager to detach buffer from.
-----------	---------------------------------------

#### Returns

0 on success, negative error code otherwise.

Definition at line 68 of file [event\\_buffer](#).

The documentation for this class was generated from the following file:

### 16.306.1 Detailed Description

```
template<typename PAYLOAD>
class L4Re::Util::Event_t< PAYLOAD >
```

Convenience wrapper for getting access to an event object.

After calling [init\(\)](#) the class supplies the event-buffer and the associated IRQ object.

Definition at line [32](#) of file [event](#).

## 16.306.2 Member Enumeration Documentation

### 16.306.2.1 Mode

```
template<typename PAYLOAD>  
enum L4Re::Util::Event_t::Mode
```

Modes of operation.

#### Enumerator

---

Mode_irq	Create an IRQ and attach, to get notifications.
Mode_polling	Do not use an IRQ.

Definition at line 38 of file [event](#).

### 16.306.3 Member Function Documentation

#### 16.306.3.1 buffer()

```
template<typename PAYLOAD>
L4Re::Event_buffer_t< PAYLOAD > & L4Re::Util::Event_t< PAYLOAD >::buffer () [inline]
```

Get event buffer.

##### Returns

[Event](#) buffer object.

Definition at line 148 of file [event](#).

#### 16.306.3.2 init()

```
template<typename PAYLOAD>
template<typename IRQ_TYPE>
int L4Re::Util::Event_t< PAYLOAD >::init (
    L4::Cap< L4Re::Event > event,
    L4Re::Env const * env = L4Re::Env::env(),
    L4Re::Cap_alloc * ca = &L4Re::Util::cap_alloc) [inline]
```

Initialise an event object.

##### Template Parameters

<i>IRQ_TYPE</i>	Type used for handling notifications from the event provider. This must be derived from <a href="#">L4::Triggerable</a> .
-----------------	---

##### Parameters

<i>event</i>	Capability to event.
<i>env</i>	Pointer to L4Re-Environment
<i>ca</i>	Pointer to capability allocator.

##### Return values

---

0	Success
-L4_ENOMEM	No memory to allocate required capabilities.
<0	Other IPC errors.

Definition at line 59 of file [event](#).

### 16.306.3.3 init\_poll()

```
template<typename PAYLOAD>
int L4Re::Util::Event_t< PAYLOAD >::init_poll (
    L4::Cap< L4Re::Event > event,
    L4Re::Env const * env = L4Re::Env::env(),
    L4Re::Cap_alloc * ca = &L4Re::Util::cap_alloc) [inline]
```

Initialise an event object in polling mode.

#### Parameters

<i>event</i>	Capability to event.
<i>env</i>	Pointer to L4Re-Environment
<i>ca</i>	Pointer to capability allocator.

#### Return values

0	Success
-L4_ENOMEM	No memory to allocate required capabilities.
<0	Other IPC errors.

Definition at line 112 of file [event](#).

### 16.306.3.4 irq()

```
template<typename PAYLOAD>
L4::Cap< L4::Triggerable > L4Re::Util::Event_t< PAYLOAD >::irq () const [inline]
```

Get event IRQ.

#### Returns

[Event](#) IRQ.

Definition at line 155 of file [event](#).

The documentation for this class was generated from the following file:

- [l4/re/util/event](#)

## 16.307 L4Re::Util::Item\_alloc\_base Class Reference

Item allocator.

*Free a capability previously acquired with [copy\\_receive\\_cap\(\)](#).*
- virtual void **free\_epiface** (L4::Epiface \*epiface)=0  
*Free epiface previously acquired with [get\\_epiface\(\)](#).*

## 16.309.1 Detailed Description

Abstract server-side implementation of the L4::Namespace interface.

### Note

The derived class is responsible for resource management through the provided interfaces. This includes freeing all resources on destruction!

Definition at line 180 of file [name\\_space\\_svr](#).

## 16.309.2 Member Function Documentation

### 16.309.2.1 alloc\_dynamic\_entry()

```
virtual Entry * L4Re::Util::Names::Name_space::alloc_dynamic_entry (
    Name const & n,
    unsigned flags) [protected], [pure virtual]
```

Allocate a new entry for the given name.

#### Parameters

<i>n</i>	<a href="#">Name</a> of the entry, must be copied.
<i>flags</i>	Entry flags, see <a href="#">Obj::Flags</a> .

#### Returns

A pointer to the newly allocated entry or NULL on error.

This method is called when a new entry was received. It must allocate memory, copy *n* out of the receive buffer and wrap everything in an Entry.

Referenced by [free\\_epiface\(\)](#).

Here is the caller graph for this function:

### 16.309.2.2 copy\_receive\_cap()

```
virtual int L4Re::Util::Names::Name_space::copy_receive_cap (
    L4::Cap< void > * cap) [protected], [pure virtual]
```

Return the receive capability for permanent use.

#### Parameters

out	cap	Capability slot with the received capability. Must be permanently available until <a href="#">free_capability()</a> is called.
-----	-----	--

This method is called when a new entry is registered together with a capability mapping. It must decide whether and where to store the capability and return the final capability slot. Typical implementations return the capability slot in the receive window and allocate a new receive window.

### 16.309.2.3 free\_capability()

```
virtual void L4Re::Util::Names::Name_space::free_capability (
    L4::Cap< void > cap) [protected], [pure virtual]
```

Free a capability previously acquired with [copy\\_receive\\_cap\(\)](#).

#### Parameters

in	cap	Capability to free.
----	-----	---------------------

Counterpart of [copy\\_receive\\_cap](#). Free the capability slot when the entry is deleted or changed.

Referenced by [free\\_epiface\(\)](#).

Here is the caller graph for this function:

### 16.309.2.4 free\_dynamic\_entry()

```
virtual void L4Re::Util::Names::Name_space::free_dynamic_entry (
    Entry * e) [protected], [pure virtual]
```

Free an entry previously allocated with [alloc\\_dynamic\\_entry\(\)](#).

#### Parameters

e	Entry to free.
---	----------------

Referenced by [free\\_epiface\(\)](#).

Here is the caller graph for this function:

### 16.309.2.5 free\_epiface()

```
virtual void L4Re::Util::Names::Name_space::free_epiface (
    L4::Epiface * epiface) [protected], [pure virtual]
```

Free epiface previously acquired with [get\\_epiface\(\)](#).

#### Parameters

in	<i>epiface</i>	Epiface to free.
----	----------------	------------------

Called when an entry that points to an epiface is deleted allowing implementations that hold resources to free them.

References [alloc\\_dynamic\\_entry\(\)](#), [free\\_capability\(\)](#), [free\\_dynamic\\_entry\(\)](#), [free\\_epiface\(\)](#), [L4\\_BASE\\_TASK\\_CAP](#), [L4\\_EEXIST](#), [L4\\_ENOMEM](#), and [L4Re::Namespace::Overwrite](#).

Referenced by [free\\_epiface\(\)](#).

Here is the call graph for this function:

Here is the caller graph for this function:

### 16.309.2.6 `get_epiface()`

```
virtual int L4Re::Util::Names::Name_space::get_epiface (
    l4_umword_t data,
    bool is_local,
    L4::Epiface ** lo) [protected], [pure virtual]
```

Return a pointer to the epiface assigned to a given label.

#### Parameters

in	<i>data</i>	Label or in the local case the capability slot of the receiving capability.
in	<i>is_local</i>	If true, a local capability slot was supplied, if false the label of a locally bound IPC gate.
out	<i>lo</i>	Pointer to epiface responsible for the capability.

#### Returns

[L4\\_EOK](#) if a valid interface could be found or an error message otherwise.

This method is called when a new entry is registered and some local ID was received for the capability. In this case, the generic implementation needs to get the epiface in order to get the capability.

The callee must make sure that the epiface remains valid until `free_epiface` is called. In particular, the capability slot must not be reallocated as long as the namespace server holds a reference to the epiface.

The documentation for this class was generated from the following file:

- `l4/re/util/name_space_svr`

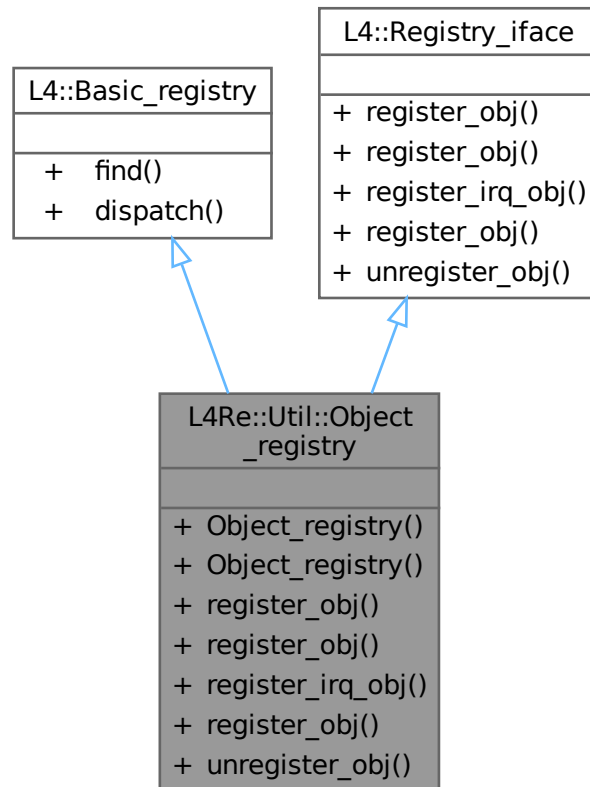

## 16.310 L4Re::Util::Object\_registry Class Reference

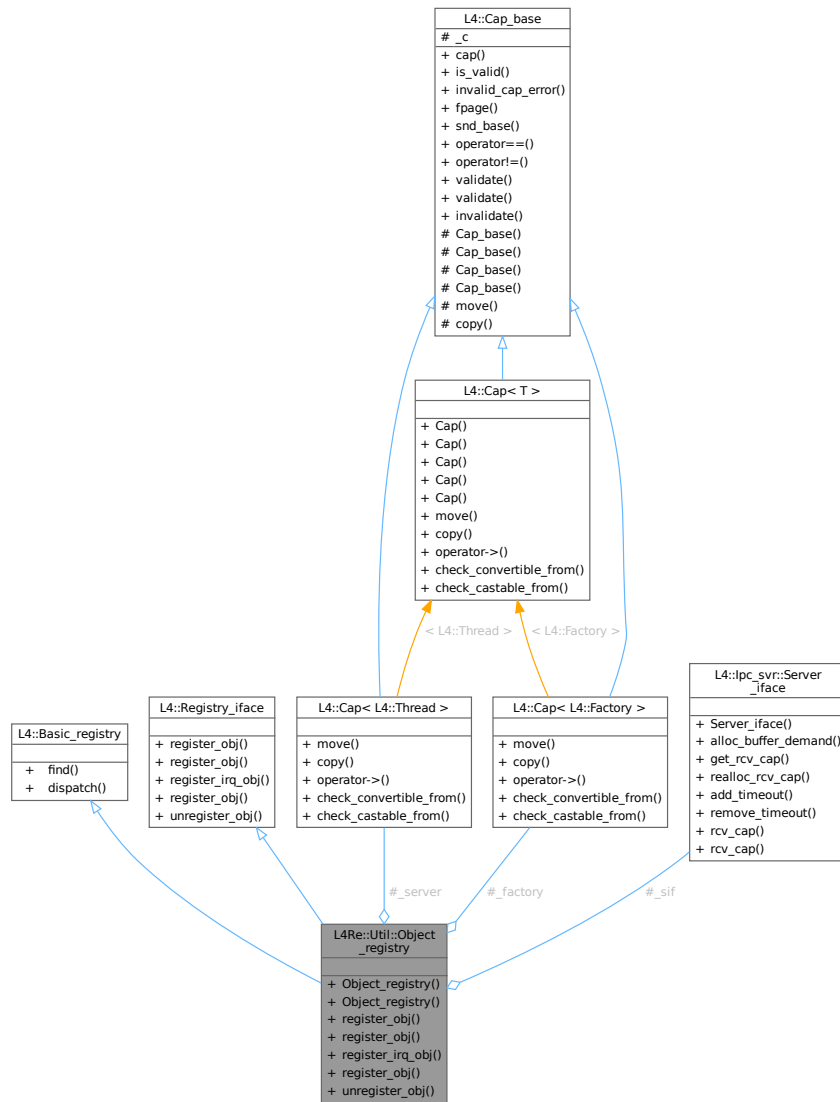

A registry that manages server objects and their attached IPC gates for a single server loop for a specific thread.

```
#include <object_registry>
```

Inheritance diagram for L4Re::Util::Object\_registry:

Collaboration diagram for L4Re::Util::Object\_registry:

## Public Member Functions

- `Object_registry (L4::lpc_svr::Server_iface *sif)`  
Create a registry for the main thread of the task using the default factory.
- `Object_registry (L4::lpc_svr::Server_iface *sif, L4::Cap< L4::Thread > server, L4::Cap< L4::Factory > factory)`  
Create a registry for arbitrary threads.
- `L4::Cap< void > register_obj (L4::Epiface *o, char const *service)` override  
Register a new server object to a pre-allocated receive endpoint.
- `L4::Cap< void > register_obj (L4::Epiface *o)` override  
Register a new server object on a newly allocated capability.
- `L4::Cap< L4::Irq > register_irq_obj (L4::Epiface *o)` override  
Register a handler for an interrupt.
- `L4::Cap< L4::Rcv_endpoint > register_obj (L4::Epiface *o, L4::Cap< L4::Rcv_endpoint > ep)` override

*Register a handler for an already existing interrupt.*

- void [unregister\\_obj](#) ([L4::Epiface](#) \*o, bool unmap=true) override

*Remove a server object from the handler list.*

### Additional Inherited Members

### Static Public Member Functions inherited from [L4::Basic\\_registry](#)

- static [Value](#) \* [find](#) ([l4\\_umword\\_t](#) label)

*Get the server object for an [lpc\\_gate](#) label.*

- static [l4\\_msgtag\\_t](#) [dispatch](#) ([l4\\_msgtag\\_t](#) tag, [l4\\_umword\\_t](#) label, [l4\\_utcb\\_t](#) \*utcb)

*The dispatch function called by the server loop.*

## 16.310.1 Detailed Description

A registry that manages server objects and their attached IPC gates for a single server loop for a specific thread.

This class manages most of the setup of a server object. If necessary, an IPC gate is created, the specified thread is bound to the IPC gate. Incoming IPC is dispatched to the server object based on the label of the IPC gate.

The object registry is also able to manage IRQ endpoints. They require a different method for the object creation. Otherwise they are handled in the same way as IPC gates: a server object is responsible to process the incoming interrupts.

Definition at line 41 of file [object\\_registry](#).

## 16.310.2 Constructor & Destructor Documentation

### 16.310.2.1 [Object\\_registry\(\)](#) [1/2]

```
L4Re::Util::Object_registry::Object_registry (
    L4::Ipc\_svr::Server\_iface * sif) [inline], [explicit]
```

Create a registry for the main thread of the task using the default factory.

#### Parameters

<i>sif</i>	Server loop interface.
------------	------------------------

Definition at line 67 of file [object\\_registry](#).

### 16.310.2.2 [Object\\_registry\(\)](#) [2/2]

```
L4Re::Util::Object_registry::Object_registry (
    L4::Ipc\_svr::Server\_iface * sif,
    L4::Cap< L4::Thread > server,
    L4::Cap< L4::Factory > factory) [inline]
```

Create a registry for arbitrary threads.

#### Parameters

<i>sif</i>	Server loop interface.
<i>server</i>	Capability to the thread that executes the server objects.
<i>factory</i>	Capability to a factory object capable of creating new IPC gates.

Definition at line 81 of file [object\\_registry](#).

### 16.310.3 Member Function Documentation

#### 16.310.3.1 register\_irq\_obj()

```
L4::Cap< L4::Irq > L4Re::Util::Object_registry::register_irq_obj (
    L4::Epiface * o) [inline], [override], [virtual]
```

Register a handler for an interrupt.

##### Parameters

<i>o</i>	Server object that handles IRQs.
----------	----------------------------------

##### Return values

<a href="#">L4::Cap&lt;L4::Irq&gt;</a>	Capability to a new IRQ object on success.
<a href="#">L4::Cap&lt;L4::Irq&gt;::Invalid</a>	The allocation of the IRQ has failed.

The IRQ will be newly allocated using the registry's factory object. The caller must call [unregister\\_obj\(\)](#) to free all resources.

Implements [L4::Registry\\_iface](#).

Definition at line 227 of file [object\\_registry](#).

#### 16.310.3.2 register\_obj() [1/3]

```
L4::Cap< void > L4Re::Util::Object_registry::register_obj (
    L4::Epiface * o) [inline], [override], [virtual]
```

Register a new server object on a newly allocated capability.

##### Parameters

<i>o</i>	Server object that handles IPC requests.
----------	--

##### Return values

---

<a href="#"><i>L4::Cap&lt;void&gt;</i></a>	A valid capability to a new IPC gate.
<a href="#"><i>L4::Cap&lt;void&gt;::Invalid</i></a>	The allocation of the IPC gate has failed.

The IPC gate will be allocated using the registry's factory. The caller must call [unregister\\_obj\(\)](#) to free all resources.

Implements [L4::Registry\\_iface](#).

Definition at line 211 of file [object\\_registry](#).

### 16.310.3.3 register\_obj() [2/3]

```
L4::Cap< void > L4Re::Util::Object_registry::register_obj (
    L4::Epiface * o,
    char const * service) [inline], [override], [virtual]
```

Register a new server object to a pre-allocated receive endpoint.

#### Parameters

<i>o</i>	Server object that handles IPC requests.
<i>service</i>	Name of a pre-allocated receive endpoint.

#### Return values

<a href="#"><i>L4::Cap&lt;void&gt;</i></a>	The capability known as <i>service</i> on success.
<a href="#"><i>L4::Cap&lt;void&gt;::Invalid</i></a>	No capability with the given name found.

The interface must be freed with [unregister\\_obj\(\)](#) by the caller to unbind the thread from the capability.

Implements [L4::Registry\\_iface](#).

Definition at line 194 of file [object\\_registry](#).

### 16.310.3.4 register\_obj() [3/3]

```
L4::Cap< L4::Rcv_endpoint > L4Re::Util::Object_registry::register_obj (
    L4::Epiface * o,
    L4::Cap< L4::Rcv_endpoint > ep) [inline], [override], [virtual]
```

Register a handler for an already existing interrupt.

#### Parameters

<i>o</i>	Server object that handles the IPC.
<i>ep</i>	Capability to a receive endpoint, may be a hardware or software interrupt or an IPC gate.

#### Return values

<a href="#">L4::Cap&lt;L4::Rcv_endpoint&gt;</a>	Capability ep on success.
<a href="#">L4::Cap&lt;L4::Rcv_endpoint&gt;::Invalid</a>	The IRQ attach operation has failed.

The interface must be freed with [unregister\\_obj\(\)](#) by the caller to unbind the thread from the capability.

Implements [L4::Registry\\_iface](#).

Definition at line 246 of file [object\\_registry](#).

### 16.310.3.5 unregister\_obj()

```
void L4Re::Util::Object_registry::unregister_obj (
    L4::Epiface * o,
    bool unmap = true) [inline], [override], [virtual]
```

Remove a server object from the handler list.

#### Parameters

<i>o</i>	Server object to unbind.
<i>unmap</i>	Specifies if the object capability shall be unmapped (true) or not. The default (true) is to unmap the capability.

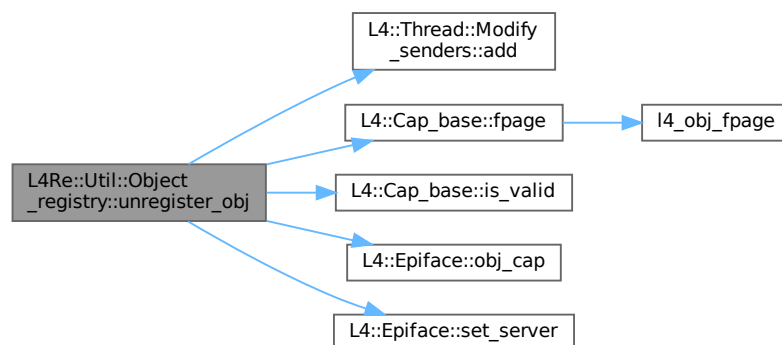

The capability used by the server object will be unmapped if `unmap` is true.

Implements [L4::Registry\\_iface](#).

Definition at line 262 of file [object\\_registry](#).

References [L4::Thread::Modify\\_senders::add\(\)](#), [L4Re::Util::cap\\_alloc](#), [L4::Cap\\_base::fpage\(\)](#), [L4::Cap\\_base::Invalid](#), [L4::Cap\\_base::is\\_valid\(\)](#), [L4\\_FP\\_ALL\\_SPACES](#), [L4::Epiface::obj\\_cap\(\)](#), and [L4::Epiface::set\\_server\(\)](#).

The documentation for this class was generated from the following file:

- `I4/re/util/object_registry`

## 16.311 L4Re::Util::Ref\_cap< T > Struct Template Reference

Automatic capability that implements automatic free and unmap of the capability selector.

```
#include <cap_alloc>
```

Inheritance diagram for L4Re::Util::Ref\_cap< T >:

Collaboration diagram for L4Re::Util::Ref\_cap< T >:

### 16.311.1 Detailed Description

```
template<typename T>
struct L4Re::Util::Ref_cap< T >
```

Automatic capability that implements automatic free and unmap of the capability selector.

#### Template Parameters

---

<b>T</b>	Type of the object that is referred by the capability.
----------	--

This kind of automatic capability implements a counted reference to a capability selector. The capability shall be unmapped and freed when the reference count in the allocator goes to zero.

#### Usage:

```
L4Re::Util::Ref_cap<L4Re::Dataspace>::Cap global_ds_cap;

{
    L4Re::Util::Ref_cap<L4Re::Dataspace>::Cap
        ds_cap(L4Re::Util::cap_alloc.alloc<L4Re::Dataspace>());
    // reference count for the allocated cap selector is now 1

    // use the dataspace cap
    L4Re::chksys(mem_alloc->alloc(4096, ds_cap.get()));

    global_ds_cap = ds_cap;
    // reference count is now 2
    ...
}
// reference count dropped to 1 (ds_cap is no longer existing).
```

Definition at line 142 of file [cap\\_alloc](#).

The documentation for this struct was generated from the following file:

- [l4/re/util/cap\\_alloc](#)

## 16.312 L4Re::Util::Ref\_del\_cap< T > Struct Template Reference

Automatic capability that implements automatic free and unmap+delete of the capability selector.

```
#include <cap_alloc>
```

Collaboration diagram for L4Re::Util::Ref\_del\_cap< T >:

### 16.312.1 Detailed Description

```
template<typename T>
struct L4Re::Util::Ref_del_cap< T >
```

Automatic capability that implements automatic free and unmap+delete of the capability selector.

#### Template Parameters

<i>T</i>	Type of the object that is referred by the capability.
----------	--

This kind of automatic capability implements a counted reference to a capability selector. The capability shall be unmapped and freed when the reference count in the allocator goes to zero. The main difference to [Ref\\_cap](#) is that the unmap is done with the deletion flag enabled and this leads to the deletion of the object if the current task holds appropriate deletion rights.

#### Usage:

```
L4Re::Util::Ref_del_cap<L4Re::Dataspace>::Cap global_ds_cap;

{
    L4Re::Util::Ref_del_cap<L4Re::Dataspace>::Cap
        ds_cap(L4Re::Util::cap_alloc.alloc<L4Re::Dataspace>());
    // reference count for the allocated cap selector is now 1

    // use the dataspace cap
    L4Re::chksys(mem_alloc->alloc(4096, ds_cap.get()));

    global_ds_cap = ds_cap;
    // reference count is now 2
    ...
}
// reference count dropped to 1 (ds_cap is no longer existing).
...
global_ds_cap = L4_INVALID_CAP;
// reference count dropped to 0 (data space shall be deleted).
```

Definition at line 183 of file [cap\\_alloc](#).

The documentation for this struct was generated from the following file:

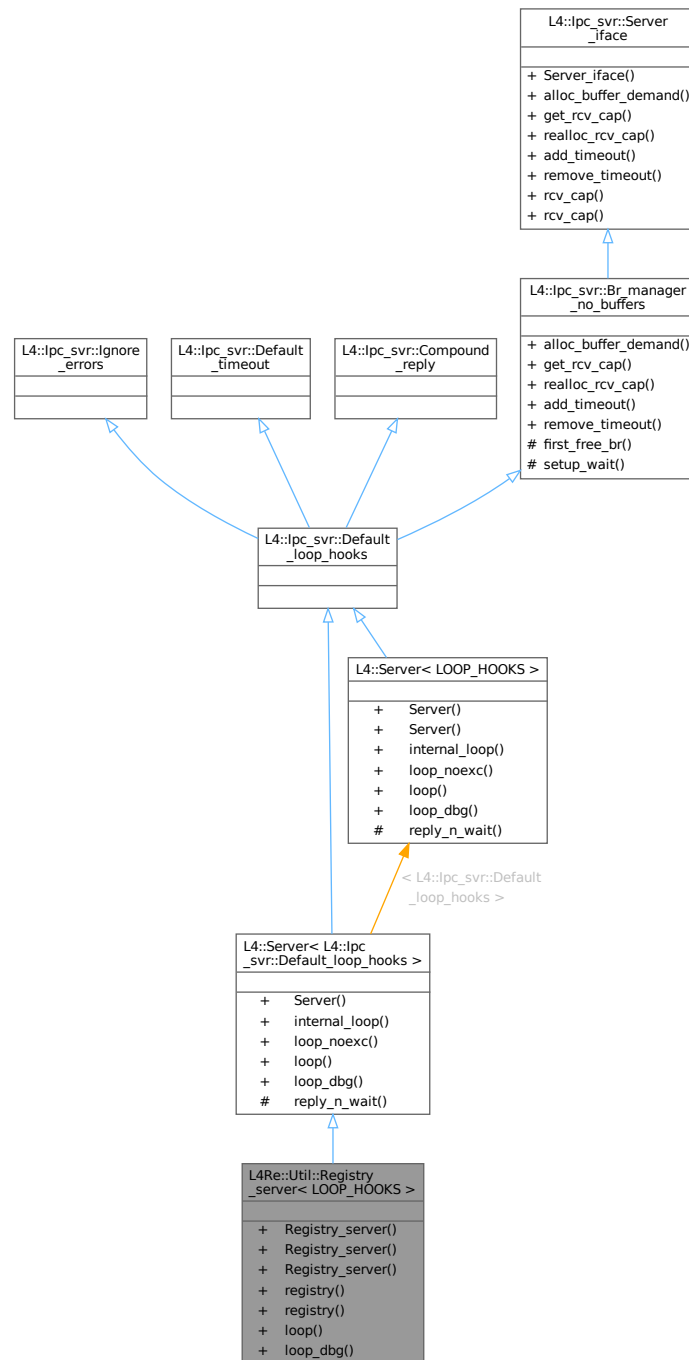

- [l4/re/util/cap\\_alloc](#)

## 16.313 L4Re::Util::Registry\_server< LOOP\_HOOKS > Class Template Reference

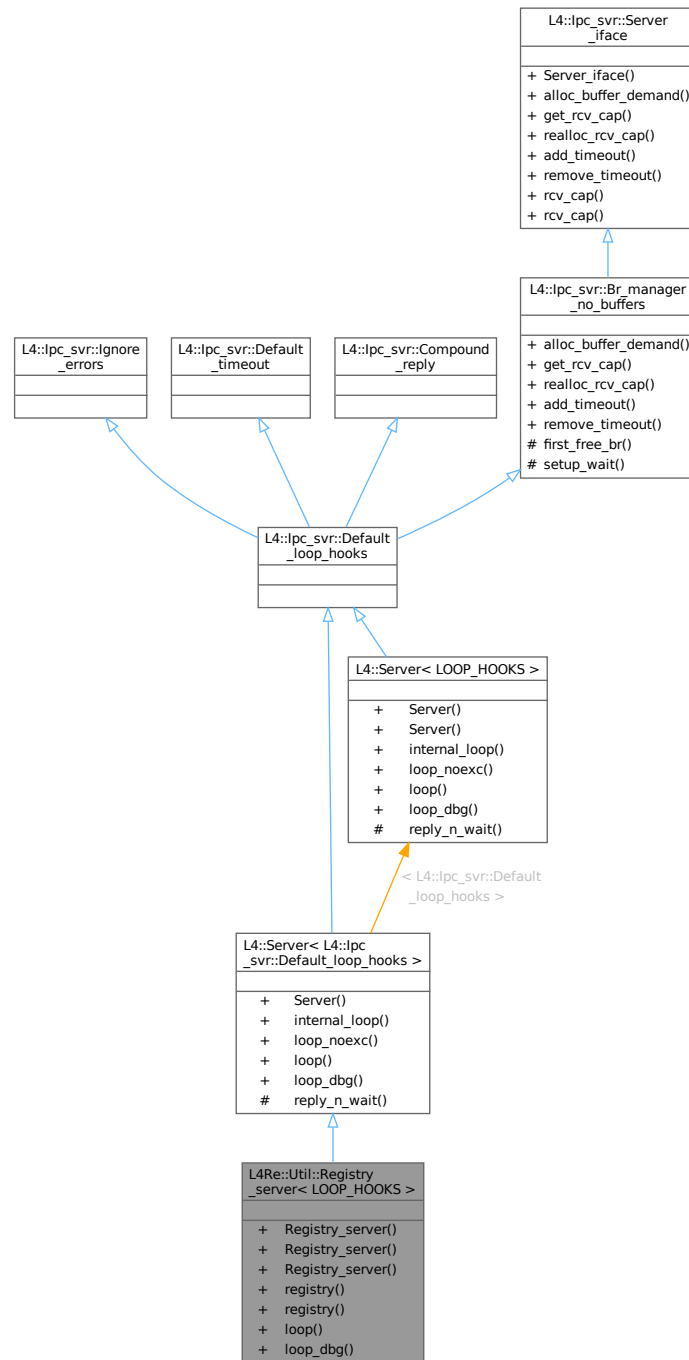

A server loop object which has a [Object\\_registry](#) included.

## 16.313.1 Detailed Description

```
template<typename LOOP_HOOKS = L4::lpc_svr::Default_loop_hooks>
class L4Re::Util::Registry_server< LOOP_HOOKS >
```

A server loop object which has a [Object\\_registry](#) included.

### Examples

[examples/clntsrv/src/server.cc](#), [examples/libs/l4re/c++/shared\\_ds/ds\\_srv.cc](#), and [examples/libs/l4re/streammap/server.cc](#).

Definition at line 293 of file [object\\_registry](#).

## 16.313.2 Constructor & Destructor Documentation

### 16.313.2.1 Registry\_server() [1/3]

```
template<typename LOOP_HOOKS = L4::lpc_svr::Default_loop_hooks>
L4Re::Util::Registry_server< LOOP_HOOKS >::Registry_server () [inline]
```

Create a new server loop object for the main thread of the task.

#### Precondition

Must be called from the main thread or behaviour is undefined.

Definition at line 305 of file [object\\_registry](#).

### 16.313.2.2 Registry\_server() [2/3]

```
template<typename LOOP_HOOKS = L4::lpc_svr::Default_loop_hooks>
L4Re::Util::Registry_server< LOOP_HOOKS >::Registry_server (
    l4\_utcb\_t * ,
    L4::Cap< L4::Thread > server,
    L4::Cap< L4::Factory > factory) [inline]
```

Create a new server loop object for an arbitrary thread and factory.

#### Parameters

<i>server</i>	Capability to thread running the server loop.
<i>factory</i>	Capability to factory object used to create new IPC gates.

**Deprecated** Note that this variant of the constructor is deprecated, please do not supply the UTCB pointer, it's not used.

Definition at line 317 of file [object\\_registry](#).

### 16.313.2.3 Registry\_server() [3/3]

```
template<typename LOOP_HOOKS = L4::Ipc_svr::Default_loop_hooks>
L4Re::Util::Registry_server< LOOP_HOOKS >::Registry_server (
    L4::Cap< L4::Thread > server,
    L4::Cap< L4::Factory > factory) [inline]
```

Create a new server loop object for an arbitrary thread and factory.

#### Parameters

<i>server</i>	Capability to thread running the server loop.
<i>factory</i>	Capability to factory object used to create new IPC gates.

Definition at line 328 of file [object\\_registry](#).

## 16.313.3 Member Function Documentation

### 16.313.3.1 loop()

```
template<typename LOOP_HOOKS = L4::Ipc_svr::Default_loop_hooks>
void L4_NORETURN L4Re::Util::Registry_server< LOOP_HOOKS >::loop (
    l4_utcb_t * utcb = l4_utcb()) [inline]
```

Start the server loop.

#### Parameters

<i>utcb</i>	The UTCB of the thread running the server loop, defaults to <a href="#">l4_utcb()</a> .
-------------	---

Definition at line 344 of file [object\\_registry](#).

References [L4\\_NORETURN](#), and [loop\(\)](#).

## 16.316 L4Re::Util::Vcon\_svr< SVR > Class Template Reference

[Console](#) server template class.

```
#include <vcon_svr>
```

Collaboration diagram for L4Re::Util::Vcon\_svr< SVR >:

### 16.316.1 Detailed Description

```
template<typename SVR>
class L4Re::Util::Vcon_svr< SVR >
```

[Console](#) server template class.

This template uses `vcon_write()` and `vcon_read()` to get and deliver data from the implementor.

`vcon_read()` needs to update the status argument with the `L4_vcon_read_stat` flags, especially the `L4_VCON_READ_STAT_DONE` flag to indicate that there's nothing more to read for the other end.

`vcon_write()` gets the live data from the UTCB. Make sure to copy out the data before using the UTCB again.

The size parameter of both functions is given in bytes.

Definition at line [36](#) of file [vcon\\_svr](#).

The documentation for this class was generated from the following file:

- `l4/re/util/vcon_svr`

## 16.317 L4Re::Util::Video::Goos\_svr Class Reference

Goos server class.

```
#include <goos_svr>
```

Collaboration diagram for L4Re::Util::Video::Goos\_svr:

*Goos memory dataspace.*

- [L4Re::Video::Goos::Info](#) [\\_screen\\_info](#)

*Goos information.*

- [L4Re::Video::View::Info](#) [\\_view\\_info](#)

*View information.*

## 16.317.1 Detailed Description

Goos server class.

Definition at line 25 of file [goos\\_svr](#).

## 16.317.2 Member Function Documentation

### 16.317.2.1 [get\\_fb\(\)](#)

```
L4::Cap< L4Re::Dataspace > L4Re::Util::Video::Goos\_svr::get\_fb () const [inline]
```

Return framebuffer memory dataspace.

#### Returns

Goos memory dataspace

Definition at line 42 of file [goos\\_svr](#).

References [\\_fb\\_ds](#).

### 16.317.2.2 [init\\_infos\(\)](#)

```
void L4Re::Util::Video::Goos\_svr::init\_infos () [inline]
```

Initialize the view information structure of this object.

This function initializes the view info structure of this goos object based on the information in the goos information, i.e. the width, height and pixel\_info of the goos information has to contain valid values before calling [init\\_info\(\)](#).

Definition at line 78 of file [goos\\_svr](#).

References [\\_screen\\_info](#), and [\\_view\\_info](#).

### 16.317.2.3 refresh()

```
virtual int L4Re::Util::Video::Goos_svr::refresh (  
    int x,  
    int y,  
    int w,  
    int h) [inline], [virtual]
```

Refresh area of the framebuffer.

#### Parameters

---

<i>x</i>	X coordinate (pixels)
<i>y</i>	Y coordinate (pixels)
<i>w</i>	Width of area in pixels
<i>h</i>	Height of area in pixels

#### Returns

0 on success, negative error code otherwise

Definition at line 66 of file [goos\\_svr](#).

References [L4\\_ENOSYS](#).

#### 16.317.2.4 screen\_info()

```
L4Re::Video::Goos::Info const * L4Re::Util::Video::Goos_svr::screen_info () const [inline]
```

Goos information structure.

#### Returns

Return goos information structure.

Definition at line 48 of file [goos\\_svr](#).

References [\\_screen\\_info](#).

#### 16.317.2.5 view\_info()

```
L4Re::Video::View::Info const * L4Re::Util::Video::Goos_svr::view_info () const [inline]
```

View information structure.

#### Returns

Return view information structure.

Definition at line 54 of file [goos\\_svr](#).

References [\\_view\\_info](#).

The documentation for this class was generated from the following file:

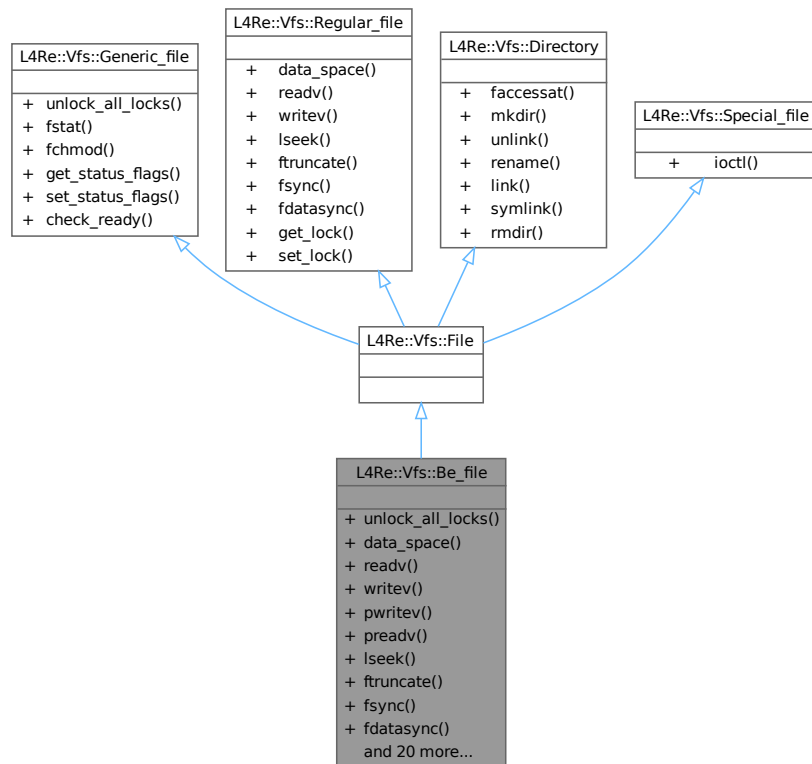

- [l4/re/util/video/goos\\_svr](#)

## 16.318 L4Re::Vfs::Be\_file Class Reference

Boiler plate class for implementing an open file for [L4Re::Vfs](#).

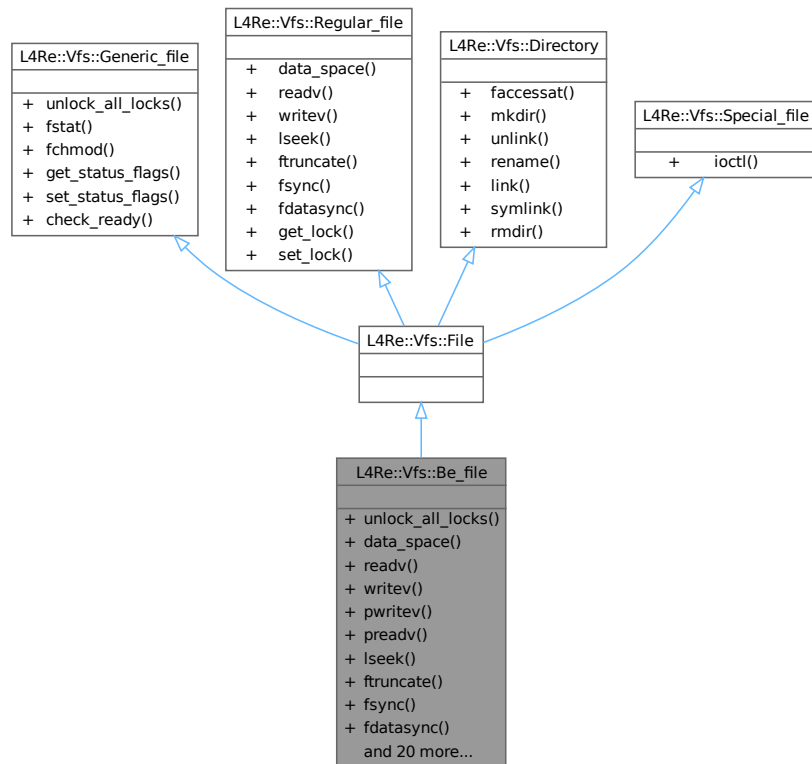

```
#include <backend>
```

Inheritance diagram for L4Re::Vfs::Be\_file:

*Default backend for POSIX symlink, symlinkat.*
- int **rmdir** (const char \*) noexcept override  
*Default backend for POSIX rmdir, rmdirat.*
- ssize\_t **readlink** (char \*, size\_t) override  
*Default backend for POSIX readlink, readlinkat.*
- bool **check\_ready** ([Ready\\_type](#)) noexcept override  
*Default implementation of a readiness check.*

### Additional Inherited Members

### Public Types inherited from [L4Re::Vfs::Generic\\_file](#)

- enum [Ready\\_type](#) : unsigned  
*Type of I/O operation/condition a file can indicate readiness.*

## 16.318.1 Detailed Description

Boiler plate class for implementing an open file for [L4Re::Vfs](#).

This class may be used as a base class for everything that a POSIX file descriptor may point to. This are things such as regular files, directories, special device files, streams, pipes, and so on.

### Examples

[tmpfs/lib/src/fs.cc](#).

Definition at line 30 of file [backend](#).

## 16.318.2 Member Function Documentation

### 16.318.2.1 `check_ready()`

```
bool L4Re::Vfs::Be_file::check_ready (
    Ready_type ) [inline], [override], [virtual], [noexcept]
```

Default implementation of a readiness check.

By default, we assume a file is not ready for an I/O operation/condition since the proper semantics of that relies on the backend.

#### Returns

Always false.

Implements [L4Re::Vfs::Generic\\_file](#).

Definition at line 217 of file [backend](#).

### 16.318.2.2 `data_space()`

```
L4::Cap< L4Re::Dataspace > L4Re::Vfs::Be_file::data_space () [inline], [override], [virtual],
[noexcept]
```

Get an [L4Re::Dataspace](#) object for the file.

This is used as a backend for POSIX mmap and mmap2 functions.

#### Note

mmap is not possible if the function returns an invalid capability.

#### Returns

A capability to an [L4Re::Dataspace](#) that represents the file contents in an [L4Re](#) way.

Implements [L4Re::Vfs::Regular\\_file](#).

Definition at line 47 of file [backend](#).

References [L4::Cap\\_base::Invalid](#).

### 16.318.2.3 `fstat()`

```
int L4Re::Vfs::Be_file::fstat (
    struct stat64 * buf) const [inline], [override], [virtual], [noexcept]
```

Get status information for the file.

This is the backend for POSIX fstat, stat, fstat64 and friends.

#### Parameters

---

out	buf	This buffer is filled with the status information.
-----	-----	--

#### Returns

0 on success, or <0 on error.

Implements [L4Re::Vfs::Generic\\_file](#).

Definition at line 86 of file [backend](#).

### 16.318.2.4 unlock\_all\_locks()

```
int L4Re::Vfs::Be_file::unlock_all_locks () [inline], [override], [virtual], [noexcept]
```

Unlock all locks on the file.

#### Note

All locks means all locks independent of which file the locks were taken by.

This method is called by the POSIX close implementation to get the POSIX semantics of releasing all locks taken by this application on a close for any fd referencing the real file.

#### Returns

0 on success, or <0 on error.

Implements [L4Re::Vfs::Generic\\_file](#).

Definition at line 43 of file [backend](#).

The documentation for this class was generated from the following file:

- [l4/l4re\\_vfs/backend](#)

## 16.319 L4Re::Vfs::Be\_file\_system Class Reference

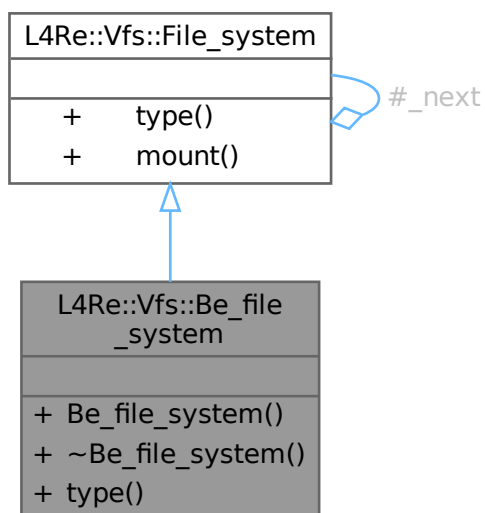

Boilerplate class for implementing a [L4Re::Vfs::File\\_system](#).

```
#include <backend>
```

Inheritance diagram for L4Re::Vfs::Be\_file\_system:

Collaboration diagram for L4Re::Vfs::Be\_file\_system:

## Public Member Functions

- [Be\\_file\\_system](#) (char const \*fstype) noexcept  
*Create a file-system object for the given fstype.*
- [~Be\\_file\\_system](#) () noexcept  
*Destroy a file-system object.*
- char const \* [type](#) () const noexcept override  
*Return the file-system type.*

## Public Member Functions inherited from [L4Re::Vfs::File\\_system](#)

- virtual int [mount](#) (char const \*source, unsigned long mountflags, void const \*data, [cxx::Ref\\_ptr](#)< [File](#) > \*dir) noexcept=0  
*Create a directory object dir representing source mounted with this file system.*

### 16.319.1 Detailed Description

Boilerplate class for implementing a [L4Re::Vfs::File\\_system](#).

This class already takes care of registering and unregistering the file system in the global registry and implements the [type\(\)](#) method.

#### Examples

[tmpfs/lib/src/fs.cc](#).

Definition at line 310 of file [backend](#).

### 16.319.2 Constructor & Destructor Documentation

#### 16.319.2.1 [Be\\_file\\_system](#)()

```
L4Re::Vfs::Be_file_system::Be_file_system (
    char const * fstype) [inline], [explicit], [noexcept]
```

Create a file-system object for the given *fstype*.

#### Parameters

<i>fstype</i>	The type that <a href="#">type()</a> shall return.
---------------	--

This constructor takes care of registering the file system in the registry of [L4Re::Vfs::vfs\\_ops](#).

Definition at line 324 of file [backend](#).

### 16.319.2.2 ~Be\_file\_system()

```
L4Re::Vfs::Be_file_system::~Be_file_system () [inline], [noexcept]
```

Destroy a file-system object.

This destructor takes care of removing this file system from the registry of L4Re::Vfs::vfs\_ops.

Definition at line 336 of file [backend](#).

## 16.319.3 Member Function Documentation

### 16.319.3.1 type()

```
char const * L4Re::Vfs::Be_file_system::type () const [inline], [override], [virtual], [noexcept]
```

Return the file-system type.

Returns the file-system type given as *fstype* in the constructor.

Implements [L4Re::Vfs::File\\_system](#).

Definition at line 346 of file [backend](#).

The documentation for this class was generated from the following file:

- [l4/l4re\\_vfs/backend](#)

## 16.320 L4Re::Vfs::Directory Class Reference

Interface for a POSIX file that is a directory.

```
#include <vfs.h>
```

Inheritance diagram for L4Re::Vfs::Directory:

Collaboration diagram for L4Re::Vfs::Directory:

L4Re::Vfs::Directory	
+	faccessat()
+	mkdir()
+	unlink()
+	rename()
+	link()
+	symlink()
+	rmdir()

### Public Member Functions

- virtual int [faccessat](#) (const char \*path, int mode, int flags) noexcept=0  
*Check access permissions on the given file.*
- virtual int [mkdir](#) (const char \*path, mode\_t mode) noexcept=0  
*Create a new subdirectory.*
- virtual int [unlink](#) (const char \*path) noexcept=0  
*Unlink the given file from that directory.*
- virtual int [rename](#) (const char \*src\_path, const char \*dst\_path) noexcept=0  
*Rename the given file.*
- virtual int [link](#) (const char \*src\_path, const char \*dst\_path) noexcept=0  
*Create a hard link (second name) for the given file.*
- virtual int [symlink](#) (const char \*src\_path, const char \*dst\_path) noexcept=0  
*Create a symbolic link for the given file.*
- virtual int [rmdir](#) (const char \*path) noexcept=0  
*Delete an empty directory.*

### 16.320.1 Detailed Description

Interface for a POSIX file that is a directory.

This interface provides functionality for directory files in the [L4Re::Vfs](#). However, real objects always use the combined [L4Re::Vfs::File](#) interface.

Definition at line 160 of file [vfs.h](#).

## 16.320.2 Member Function Documentation

### 16.320.2.1 faccessat()

```
virtual int L4Re::Vfs::Directory::faccessat (
    const char * path,
    int mode,
    int flags) [pure virtual], [noexcept]
```

Check access permissions on the given file.

Backend function for POSIX access and faccessat functions.

#### Parameters

<i>path</i>	The path relative to this directory. Note: <i>path</i> is relative to this directory and may contain subdirectories.
<i>mode</i>	The access mode to check.
<i>flags</i>	The flags as in POSIX faccessat (AT_EACCESS, AT_SYMLINK_NOFOLLOW).

#### Returns

0 on success, or <0 on error.

Implemented in [L4Re::Vfs::Be\\_file](#).

### 16.320.2.2 link()

```
virtual int L4Re::Vfs::Directory::link (
    const char * src_path,
    const char * dst_path) [pure virtual], [noexcept]
```

Create a hard link (second name) for the given file.

Backend for the POSIX link and linkat functions.

#### Parameters

<i>src_path</i>	The old name of the file. Note: <i>src_path</i> is relative to this directory and may contain subdirectories.
<i>dst_path</i>	The new (second) name for the file. Note: <i>dst_path</i> is relative to this directory and may contain subdirectories.

#### Returns

0 on success, or <0 on error.

Implemented in [L4Re::Vfs::Be\\_file](#).

### 16.320.2.3 mkdir()

```
virtual int L4Re::Vfs::Directory::mkdir (
    const char * path,
    mode_t mode) [pure virtual], [noexcept]
```

Create a new subdirectory.

Backend for POSIX mkdir and mkdirat function calls.

#### Parameters

<i>path</i>	The name of the subdirectory to create. Note: <i>path</i> is relative to this directory and may contain subdirectories.
<i>mode</i>	The file mode to use for the new directory.

**Returns**

0 on success, or <0 on error. -ENOTDIR if this or some component in path is not a directory.

Implemented in [L4Re::Vfs::Be\\_file](#).

**16.320.2.4 rename()**

```
virtual int L4Re::Vfs::Directory::rename (  
    const char * src_path,  
    const char * dst_path) [pure virtual], [noexcept]
```

Rename the given file.

Backend for the POSIX rename, renameat functions.

**Parameters**

<i>src_path</i>	The old name of the file to rename. Note: <i>src_path</i> is relative to this directory and may contain subdirectories.
<i>dst_path</i>	The new name for the file. Note: <i>dst_path</i> is relative to this directory and may contain subdirectories.

**Returns**

0 on success, or <0 on error.

Implemented in [L4Re::Vfs::Be\\_file](#).

**16.320.2.5 rmdir()**

```
virtual int L4Re::Vfs::Directory::rmdir (  
    const char * path) [pure virtual], [noexcept]
```

Delete an empty directory.

Backend for POSIX rmdir, rmdirat functions.

**Parameters**

<i>path</i>	The name of the directory to remove. Note: <i>path</i> is relative to this directory and may contain subdirectories.
-------------	--

**Returns**

0 on success, or <0 on error.

Implemented in [L4Re::Vfs::Be\\_file](#).

### 16.320.2.6 symlink()

```
virtual int L4Re::Vfs::Directory::symlink (
    const char * src_path,
    const char * dst_path) [pure virtual], [noexcept]
```

Create a symbolic link for the given file.

Backend for the POSIX symlink and symlinkat functions.

#### Parameters

<i>src_path</i>	The old name of the file. Note: <i>src_path</i> shall be an absolute path.
<i>dst_path</i>	The name for symlink. Note: <i>dst_path</i> is relative to this directory and may contain subdirectories.

#### Returns

0 on success, or <0 on error.

Implemented in [L4Re::Vfs::Be\\_file](#).

### 16.320.2.7 unlink()

```
virtual int L4Re::Vfs::Directory::unlink (
    const char * path) [pure virtual], [noexcept]
```

Unlink the given file from that directory.

Backend for the POSIX unlink and unlinkat functions.

#### Parameters

<i>path</i>	The name of the file to unlink. Note: <i>path</i> is relative to this directory and may contain subdirectories.
-------------	---

#### Returns

0 on success, or <0 on error.

Implemented in [L4Re::Vfs::Be\\_file](#).

The documentation for this class was generated from the following file:

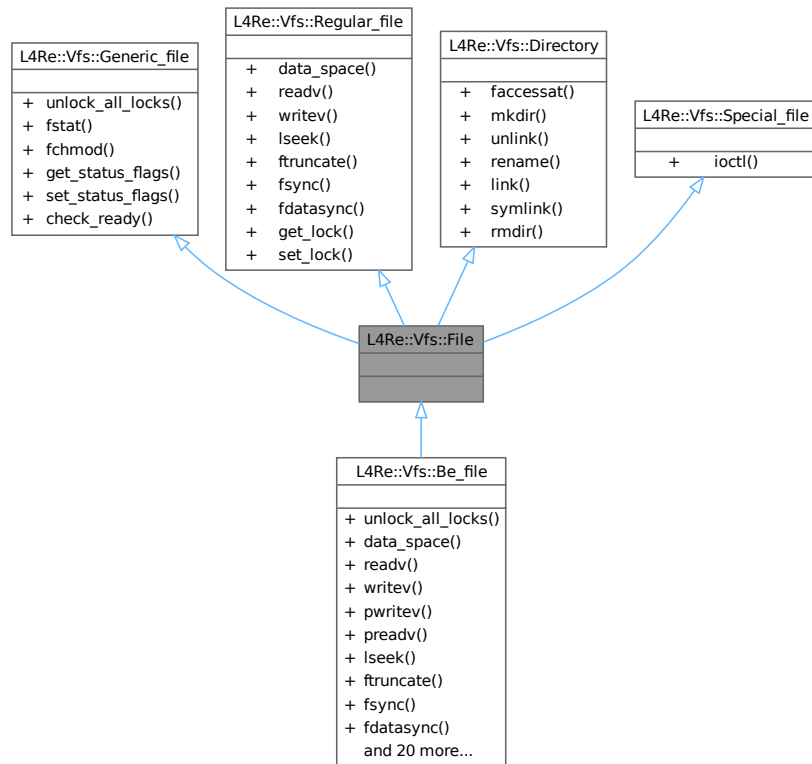

- l4/l4re\_vfs/vfs.h

## 16.321 L4Re::Vfs::File Class Reference

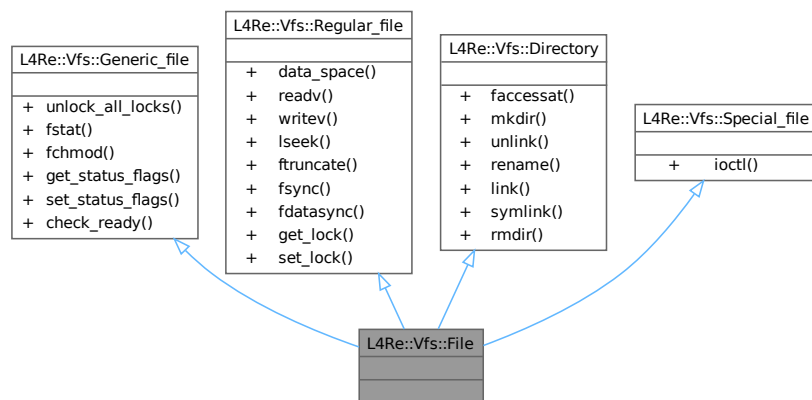

The basic interface for an open POSIX file.

```
#include <vfs.h>
```

- virtual int [rename](#) (const char \*src\_path, const char \*dst\_path) noexcept=0  
*Rename the given file.*
- virtual int [link](#) (const char \*src\_path, const char \*dst\_path) noexcept=0  
*Create a hard link (second name) for the given file.*
- virtual int [symlink](#) (const char \*src\_path, const char \*dst\_path) noexcept=0  
*Create a symbolic link for the given file.*
- virtual int [rmdir](#) (const char \*path) noexcept=0  
*Delete an empty directory.*

## Public Member Functions inherited from [L4Re::Vfs::Special\\_file](#)

- virtual int [ioctl](#) (unsigned long cmd, va\_list args) noexcept=0  
*The famous IO control.*

### 16.321.1 Detailed Description

The basic interface for an open POSIX file.

An open POSIX file can be anything that hides behind a POSIX file descriptor. This means that even directories are files. An open file can be anything from a directory to a special device file so see [Generic\\_file](#), [Regular\\_file](#), [Directory](#), and [Special\\_file](#) for more information.

#### Note

For implementing a backend for the [L4Re::Vfs](#) [L4Re::Vfs::Be\\_file](#) may be used as a base class.

Definition at line 455 of file [vfs.h](#).

The documentation for this class was generated from the following file:

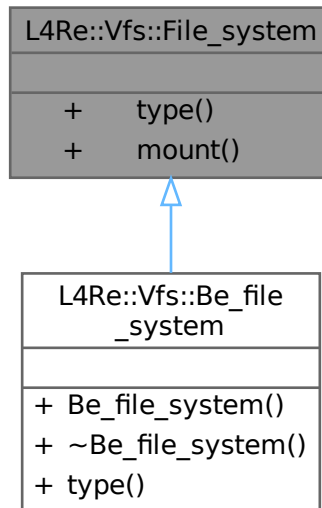

- [l4/l4re\\_vfs/vfs.h](#)

## 16.322 L4Re::Vfs::File\_system Class Reference

Basic interface for an [L4Re::Vfs](#) file system.

```
#include <vfs.h>
```

Inheritance diagram for L4Re::Vfs::File\_system:

Collaboration diagram for L4Re::Vfs::File\_system:

### Public Member Functions

- virtual char const \* [type](#) () const noexcept=0  
*Returns the type of the file system used in mount as fstype argument.*
- virtual int [mount](#) (char const \*source, unsigned long mountflags, void const \*data, [cxx::Ref\\_ptr](#)< [File](#) > \*dir) noexcept=0  
*Create a directory object dir representing source mounted with this file system.*

### 16.322.1 Detailed Description

Basic interface for an [L4Re::Vfs](#) file system.

#### Note

For implementing a special file system [L4Re::Vfs::Be\\_file\\_system](#) may be used as a base class.

The main purpose of this interface is to have a single object for each supported file-system type (e.g., ext2, vfat) that exists in the application and is registered at the [L4Re::Vfs::Fs](#) singleton available via [L4Re::Vfs::vfs\\_ops](#). Ultimately, the POSIX mount function calls the [File\\_system::mount](#) method matching the file-system type given in mount.

Definition at line 857 of file [vfs.h](#).

### 16.322.2 Member Function Documentation

#### 16.322.2.1 mount()

```
virtual int L4Re::Vfs::File_system::mount (
    char const * source,
    unsigned long mountflags,
    void const * data,
    cxx::Ref_ptr< File > * dir) [pure virtual], [noexcept]
```

Create a directory object *dir* representing *source* mounted with this file system.

#### Parameters

	<i>source</i>	The path to the source device to mount. This may also be some URL or anything file-system specific.
	<i>mountflags</i>	The mount flags as specified in the POSIX mount call.
	<i>data</i>	The data as specified in the POSIX mount call. The contents are file-system specific.
out	<i>dir</i>	A new directory object representing the file-system root directory.

#### Returns

0 on success, and <0 on error (e.g. -EINVAL).

References [mount\(\)](#).

Referenced by [mount\(\)](#).

Here is the call graph for this function:

Here is the caller graph for this function:

#### 16.322.2.2 `type()`

```
virtual char const * L4Re::Vfs::File_system::type () const [pure virtual], [noexcept]
```

Returns the type of the file system used in mount as fstype argument.

##### Note

This method is already provided by [Be\\_file\\_system](#).

Implemented in [L4Re::Vfs::Be\\_file\\_system](#).

The documentation for this class was generated from the following file:

- `l4/l4re_vfs/vfs.h`

## 16.323 L4Re::Vfs::Fs Class Reference

POSIX File-system related functionality.

```
#include <vfs.h>
```

Inheritance diagram for L4Re::Vfs::Fs:

Collaboration diagram for L4Re::Vfs::Fs:

## Public Member Functions

- virtual `cxx::Ref_ptr< File > get_file` (int fd) noexcept=0  
*Get the `L4Re::Vfs::File` for the file descriptor fd.*
- virtual `cxx::Ref_ptr< File > get_root` () noexcept=0  
*Get the directory object for the application's root directory.*
- virtual `cxx::Ref_ptr< File > get_cwd` () noexcept  
*Get the directory object for the application's current working directory.*
- virtual void `set_cwd` (cxx::Ref\_ptr< File > const &) noexcept  
*Set the current working directory for the application.*
- virtual int `alloc_fd` (cxx::Ref\_ptr< File > const &f=cxx::Ref\_ptr<>::Nil) noexcept=0  
*Allocate the next free file descriptor.*
- virtual `cxx::Pair< cxx::Ref_ptr< File >, int > set_fd` (int fd, cxx::Ref\_ptr< File > const &f=cxx::Ref\_ptr<>::Nil) noexcept=0  
*Set the file object referenced by the file descriptor fd.*
- virtual `cxx::Ref_ptr< File > free_fd` (int fd) noexcept=0  
*Free the file descriptor fd.*
- virtual int `mount` (char const \*path, cxx::Ref\_ptr< File > const &dir) noexcept=0  
*Mount a given file object at the given global path in the VFS.*
- int `mount` (char const \*source, char const \*target, char const \*fstype, unsigned long mountflags, void const \*data) noexcept  
*Backend for the POSIX mount call.*

### 16.323.1 Detailed Description

POSIX File-system related functionality.

#### Note

This class usually exists as a singleton and as a superclass of `L4Re::Vfs::Ops` (

#### See also

`L4Re::Vfs::vfs_ops`).

Definition at line 946 of file `vfs.h`.

### 16.323.2 Member Function Documentation

#### 16.323.2.1 alloc\_fd()

```
virtual int L4Re::Vfs::Fs::alloc_fd (
    cxx::Ref_ptr< File > const & f = cxx::Ref_ptr<>::Nil) [pure virtual], [noexcept]
```

Allocate the next free file descriptor.

#### Parameters

<i>f</i>	The file to assign to that file descriptor.
----------	---

**Returns**

The allocated file descriptor, or -EMFILE on error.

**16.323.2.2 free\_fd()**

```
virtual cxx::Ref_ptr< File > L4Re::Vfs::Fs::free_fd (
    int fd) [pure virtual], [noexcept]
```

Free the file descriptor *fd*.

**Parameters**

<i>fd</i>	The file descriptor to free.
-----------	------------------------------

**Returns**

A pointer to the file object that was assigned to the *fd*.

**16.323.2.3 get\_file()**

```
virtual cxx::Ref_ptr< File > L4Re::Vfs::Fs::get_file (
    int fd) [pure virtual], [noexcept]
```

Get the [L4Re::Vfs::File](#) for the file descriptor *fd*.

**Parameters**

<i>fd</i>	The POSIX file descriptor number.
-----------	-----------------------------------

**Returns**

A pointer to the [File](#) object, or 0 if *fd* is not open.

**16.323.2.4 mount()**

```
virtual int L4Re::Vfs::Fs::mount (
    char const * path,
    cxx::Ref_ptr< File > const & dir) [pure virtual], [noexcept]
```

Mount a given file object at the given global path in the VFS.

**Parameters**

<i>path</i>	The global path to mount <i>dir</i> at.
<i>dir</i>	A pointer to the file/directory object that shall be mounted at <i>path</i> .

**Returns**

0 on success, or <0 on error.

References [mount\(\)](#).

Referenced by [mount\(\)](#), and [mount\(\)](#).

Here is the call graph for this function:

Here is the caller graph for this function:

**16.323.2.5 set\_fd()**

```

virtual cxx::Pair< cxx::Ref_ptr< File >, int > L4Re::Vfs::Fs::set_fd (
    int fd,
    cxx::Ref_ptr< File > const & f = cxx::Ref_ptr<>::Nil) [pure virtual], [noexcept]
  
```

Set the file object referenced by the file descriptor *fd*.

**Parameters**

<i>fd</i>	The file descriptor to set to <i>f</i> .
-----------	--

<i>f</i>	The file object to assign.
----------	----------------------------

#### Returns

A pair of a pointer to the file object that was previously assigned to `fd` (`first`) and a return value (`second`). `second` contains `-#EBADF` if the passed file descriptor is outside the valid range. `first` contains a `Nil` pointer in that case. On success, `second` contains 0.

The documentation for this class was generated from the following files:

- `l4/l4re_vfs/vfs.h`
- `l4/l4re_vfs/impl/vfs_impl.h`

## 16.324 L4Re::Vfs::Generic\_file Class Reference

The common interface for an open POSIX file.

```
#include <vfs.h>
```

Inheritance diagram for L4Re::Vfs::Generic\_file:

Collaboration diagram for L4Re::Vfs::Generic\_file:

*Change POSIX access rights on the file.*
- virtual int [get\\_status\\_flags](#) () const noexcept=0  
*Get file status flags (fcntl F\_GETFL).*
- virtual int [set\\_status\\_flags](#) (long flags) noexcept=0  
*Set file status flags (fcntl F\_SETFL).*
- virtual bool [check\\_ready](#) ([Ready\\_type](#) rt) noexcept=0  
*Check whether the file is ready for an I/O operation/condition.*

### 16.324.1 Detailed Description

The common interface for an open POSIX file.

This interface is common to all kinds of open files, independent of the file type (e.g., directory, regular file etc.). However, in the [L4Re::Vfs](#) the interface [File](#) is used for every real object.

See also

[L4Re::Vfs::File](#) for more information.

Definition at line 52 of file [vfs.h](#).

## 16.324.2 Member Enumeration Documentation

### 16.324.2.1 Ready\_type

```
enum L4Re::Vfs::Generic_file::Ready_type : unsigned
```

Type of I/O operation/condition a file can indicate readiness.

As defined by select() and similar functions.

Definition at line 60 of file [vfs.h](#).

## 16.324.3 Member Function Documentation

### 16.324.3.1 check\_ready()

```
virtual bool L4Re::Vfs::Generic_file::check_ready (
    Ready_type rt) [pure virtual], [noexcept]
```

Check whether the file is ready for an I/O operation/condition.

This method is used by the implementation of select() and similar functions.

#### Parameters

<i>rt</i>	Type of the I/O operation/condition to be ready, as defined by the select() and similar functions (Read, Write, Exception).
-----------	---

#### Return values

<i>true</i>	The file is ready for the given type of I/O operation/condition.
<i>false</i>	The file is not ready for the given type of I/O operation/condition.

Implemented in [L4Re::Vfs::Be\\_file](#).

References [check\\_ready\(\)](#).

Referenced by [check\\_ready\(\)](#).

Here is the call graph for this function:

Here is the caller graph for this function:

### 16.324.3.2 fchmod()

```
virtual int L4Re::Vfs::Generic_file::fchmod (
    mode_t ) [pure virtual], [noexcept]
```

Change POSIX access rights on the file.

Backend for POSIX chmod and fchmod.

Implemented in [L4Re::Vfs::Be\\_file](#).

References [fchmod\(\)](#).

Referenced by [fchmod\(\)](#).

Here is the call graph for this function:

Here is the caller graph for this function:

### 16.324.3.3 fstat()

```
virtual int L4Re::Vfs::Generic_file::fstat (  
    struct stat64 * buf) const [pure virtual], [noexcept]
```

Get status information for the file.

This is the backend for POSIX fstat, stat, fstat64 and friends.

#### Parameters

out	buf	This buffer is filled with the status information.
-----	-----	--

#### Returns

0 on success, or <0 on error.

Implemented in [L4Re::Vfs::Be\\_file](#).

References [fstat\(\)](#).

Referenced by [fstat\(\)](#).

Here is the call graph for this function:

Here is the caller graph for this function:

#### 16.324.3.4 get\_status\_flags()

```
virtual int L4Re::Vfs::Generic_file::get_status_flags () const [pure virtual], [noexcept]
```

Get file status flags (fcntl F\_GETFL).

This function is used by the fcntl implementation for the F\_GETFL command.

##### Returns

flags such as O\_RDONLY, O\_WRONLY, O\_RDWR, O\_DIRECT, O\_ASYNC, O\_NOATIME, O\_NONBLOCK, or <0 on error.

Implemented in [L4Re::Vfs::Be\\_file](#).

References [get\\_status\\_flags\(\)](#).

Referenced by [get\\_status\\_flags\(\)](#).

Here is the call graph for this function:

Here is the caller graph for this function:

#### 16.324.3.5 set\_status\_flags()

```
virtual int L4Re::Vfs::Generic_file::set_status_flags (
    long flags) [pure virtual], [noexcept]
```

Set file status flags (fcntl F\_SETFL).

This function is used by the fcntl implementation for the F\_SETFL command.

##### Parameters

<i>flags</i>	The file status flags to set. This must be a combination of <code>O_RDONLY</code> , <code>O_WRONLY</code> , <code>O_RDWR</code> , <code>O_APPEND</code> , <code>O_ASYNC</code> , <code>O_DIRECT</code> , <code>O_NOATIME</code> , <code>O_NONBLOCK</code> .
--------------	---

**Note**

Creation flags such as `O_CREAT`, `O_EXCL`, `O_NOCTTY`, `O_TRUNC` are ignored.

**Returns**

0 on success, or <0 on error.

Implemented in [L4Re::Vfs::Be\\_file](#).

References [set\\_status\\_flags\(\)](#).

Referenced by [set\\_status\\_flags\(\)](#).

Here is the call graph for this function:

Here is the caller graph for this function:

### 16.324.3.6 unlock\_all\_locks()

```
virtual int L4Re::Vfs::Generic_file::unlock_all_locks () [pure virtual], [noexcept]
```

Unlock all locks on the file.

#### Note

All locks means all locks independent of which file the locks were taken by.

This method is called by the POSIX close implementation to get the POSIX semantics of releasing all locks taken by this application on a close for any fd referencing the real file.

#### Returns

0 on success, or <0 on error.

Implemented in [L4Re::Vfs::Be\\_file](#).

References [unlock\\_all\\_locks\(\)](#).

Referenced by [unlock\\_all\\_locks\(\)](#).

Here is the call graph for this function:

Here is the caller graph for this function:

The documentation for this class was generated from the following file:

- `l4/l4re_vfs/vfs.h`

## 16.325 L4Re::Vfs::Mman Class Reference

Interface for POSIX memory management.

```
#include <vfs.h>
```

Inheritance diagram for L4Re::Vfs::Mman:

Collaboration diagram for L4Re::Vfs::Mman:

## Public Member Functions

- virtual int **mmap2** (void \*start, size\_t len, int prot, int flags, int fd, off\_t offset, void \*\*ptr) noexcept=0

### 16.327.1 Detailed Description

Interface for a POSIX file that provides regular file semantics.

Real objects always use the combined [L4Re::Vfs::File](#) interface.

Definition at line 287 of file [vfs.h](#).

## 16.327.2 Member Function Documentation

### 16.327.2.1 data\_space()

```
virtual L4::Cap< L4Re::Dataspace > L4Re::Vfs::Regular_file::data_space () [pure virtual],
[noexcept]
```

Get an [L4Re::Dataspace](#) object for the file.

This is used as a backend for POSIX mmap and mmap2 functions.

#### Note

mmap is not possible if the function returns an invalid capability.

#### Returns

A capability to an [L4Re::Dataspace](#) that represents the file contents in an [L4Re](#) way.

Implemented in [L4Re::Vfs::Be\\_file](#).

### 16.327.2.2 fdatsync()

```
virtual int L4Re::Vfs::Regular_file::fdatsync () const [pure virtual], [noexcept]
```

Sync the data to persistent storage.

This is the backend for POSIX fdatsync.

Implemented in [L4Re::Vfs::Be\\_file](#).

References [fdatsync\(\)](#).

Referenced by [fdatsync\(\)](#).

Here is the call graph for this function:

Here is the caller graph for this function:

### 16.327.2.3 fsync()

```
virtual int L4Re::Vfs::Regular_file::fsync () const [pure virtual], [noexcept]
```

Sync the data and meta data to persistent storage.

This is the backend for POSIX fsync.

Implemented in [L4Re::Vfs::Be\\_file](#).

References [fsync\(\)](#).

Referenced by [fsync\(\)](#).

Here is the call graph for this function:

Here is the caller graph for this function:

### 16.327.2.4 ftruncate()

```
virtual int L4Re::Vfs::Regular_file::ftruncate (
    off64_t pos) [pure virtual], [noexcept]
```

Truncate the file at the given position.

This function is the backend for truncate and friends.

#### Parameters

---

<i>pos</i>	The offset at which the file shall be truncated.
------------	--

**Returns**

0 on success, or <0 on error.

Implemented in [L4Re::Vfs::Be\\_file](#).

References [ftruncate\(\)](#).

Referenced by [ftruncate\(\)](#).

Here is the call graph for this function:

Here is the caller graph for this function:

**16.327.2.5 get\_lock()**

```
virtual int L4Re::Vfs::Regular_file::get_lock (
    struct flock64 * lock) [pure virtual], [noexcept]
```

Test if the given lock can be placed in the file.

This function is used as backend for fcntl F\_GETLK commands.

**Parameters**

<i>lock</i>	The lock that shall be placed on the file. The <i>l_type</i> member will contain <code>F_UNLCK</code> if the lock could be placed.
-------------	--

#### Returns

0 on success, <0 on error.

Implemented in [L4Re::Vfs::Be\\_file](#).

References [get\\_lock\(\)](#).

Referenced by [get\\_lock\(\)](#).

Here is the call graph for this function:

Here is the caller graph for this function:

#### 16.327.2.6 lseek()

```
virtual off64_t L4Re::Vfs::Regular_file::lseek (
    off64_t ,
    int ) [pure virtual], [noexcept]
```

Change the file pointer.

This is the backend for POSIX seek, lseek and friends.

#### Returns

The new file position, or <0 on error.

Implemented in [L4Re::Vfs::Be\\_file](#).

References [lseek\(\)](#).

Referenced by [lseek\(\)](#).

Here is the call graph for this function:

Here is the caller graph for this function:

#### 16.327.2.7 readv()

```
virtual ssize_t L4Re::Vfs::Regular_file::readv (  
    const struct iovec * ,  
    int iovcnt) [pure virtual], [noexcept]
```

Read one or more blocks of data from the file.

This function acts as backend for POSIX read and readv calls and reads data starting from the `f_pos` pointer of that open file. The file pointer is advanced according to the number of bytes read.

**Returns**

The number of bytes read from the file, or <0 on error.

Implemented in [L4Re::Vfs::Be\\_file](#).

References [readv\(\)](#).

Referenced by [readv\(\)](#).

Here is the call graph for this function:

Here is the caller graph for this function:

**16.327.2.8 set\_lock()**

```
virtual int L4Re::Vfs::Regular_file::set_lock (
    struct flock64 * lock,
    bool wait) [pure virtual], [noexcept]
```

Acquire or release the given lock on the file.

This function is used as backend for fcntl F\_SETLK and F\_SETLKW commands.

**Parameters**

<i>lock</i>	The lock that shall be placed on the file.
-------------	--

<i>wait</i>	If true, then block if there is a conflicting lock on the file.
-------------	---

**Returns**

0 on success, <0 on error.

Implemented in [L4Re::Vfs::Be\\_file](#).

References [set\\_lock\(\)](#).

Referenced by [set\\_lock\(\)](#).

Here is the call graph for this function:

Here is the caller graph for this function:

**16.327.2.9 writev()**

```
virtual ssize_t L4Re::Vfs::Regular_file::writev (
    const struct iovec * ,
    int iovcnt) [pure virtual], [noexcept]
```

Write one or more blocks of data to the file.

This function acts as backend for POSIX write and writev calls. The data is written starting at the current file pointer and the file pointer must be advanced according to the number of written bytes.

### Returns

The number of bytes written to the file, or <0 on error.

Implemented in [L4Re::Vfs::Be\\_file](#).

References [writev\(\)](#).

Referenced by [writev\(\)](#).

Here is the call graph for this function:

Here is the caller graph for this function:

The documentation for this class was generated from the following file:

## 16.328 L4Re::Vfs::Special\_file Class Reference

Interface for a POSIX file that provides special file semantics.

```
#include <vfs.h>
```

Inheritance diagram for L4Re::Vfs::Special\_file:

Collaboration diagram for L4Re::Vfs::Special\_file:

## Public Member Functions

- virtual int [ioctl](#) (unsigned long cmd, va\_list args) noexcept=0  
*The famous IO control.*

### 16.328.1 Detailed Description

Interface for a POSIX file that provides special file semantics.

Real objects always use the combined [L4Re::Vfs::File](#) interface.

Definition at line [420](#) of file [vfs.h](#).

### 16.328.2 Member Function Documentation

#### 16.328.2.1 ioctl()

```
virtual int L4Re::Vfs::Special_file::ioctl (  
    unsigned long cmd,  
    va_list args) [pure virtual], [noexcept]
```

The famous IO control.

Backend for POSIX generic object invocation ioctl.

#### Parameters

<i>cmd</i>	The ioctl command.
<i>args</i>	The arguments for the ioctl, usually some kind of pointer.

#### Returns

>=0 on success, or <0 on error.

Implemented in [L4Re::Vfs::Be\\_file](#).

The documentation for this class was generated from the following file:

- [l4/l4re\\_vfs/vfs.h](#)

## 16.329 L4Re::Video::Color\_component Class Reference

A color component.

```
#include <colors>
```

Collaboration diagram for L4Re::Video::Color\_component:

void **dump** (OUT &s) const  
*Dump information on the view information to a stream.*

### 16.329.1 Detailed Description

A color component.

Definition at line 21 of file [colors](#).

## 16.329.2 Constructor & Destructor Documentation

### 16.329.2.1 Color\_component()

```
L4Re::Video::Color_component::Color_component (
    unsigned char bits,
    unsigned char shift) [inline]
```

Constructor.

#### Parameters

<i>bits</i>	Number of bits used by the component
<i>shift</i>	Position in bits of the component in the pixel

Definition at line 36 of file [colors](#).

References [shift\(\)](#).

Here is the call graph for this function:

## 16.329.3 Member Function Documentation

### 16.329.3.1 dump()

```
template<typename OUT>
void L4Re::Video::Color_component::dump (
    OUT & s) const [inline]
```

Dump information on the view information to a stream.

#### Parameters

<i>s</i>	Stream
----------	--------

Definition at line 81 of file [colors](#).

References [shift\(\)](#), and [size\(\)](#).

Here is the call graph for this function:

### 16.329.3.2 `get()`

```
int L4Re::Video::Color_component::get (  
    unsigned long v) const [inline]
```

Get component from value (normalized to 16bits).

#### Parameters

<i>v</i>	Value
----------	-------

#### Returns

Converted value

Definition at line 63 of file [colors](#).

### 16.329.3.3 `operator==()`

```
bool L4Re::Video::Color_component::operator== (  
    Color_component const & o) const [inline]
```

Compare for equality.

**Returns**

True if the same components are described, false if not.

Definition at line 55 of file [colors](#).

References [Color\\_component\(\)](#).

Here is the call graph for this function:

**16.329.3.4 set()**

```
long unsigned L4Re::Video::Color_component::set (
    int v) const [inline]
```

Transform 16bit normalized value to the component in the color space.

**Parameters**

<i>v</i>	Value return Converted value.
----------	-------------------------------

Definition at line 73 of file [colors](#).

**16.329.3.5 shift()**

```
unsigned char L4Re::Video::Color_component::shift () const [inline]
```

Return the position of the component in the pixel.

**Returns**

Position in bits of the component in the pixel

Definition at line 49 of file [colors](#).

Referenced by [Color\\_component\(\)](#), and [dump\(\)](#).

Here is the caller graph for this function:

### 16.329.3.6 size()

```
unsigned char L4Re::Video::Color_component::size () const [inline]
```

Return the number of bits used by the component.

#### Returns

Number of bits used by the component

Definition at line 43 of file [colors](#).

Referenced by [dump\(\)](#).

Here is the caller graph for this function:

The documentation for this class was generated from the following file:

- static void `__check_protocols__()` noexcept  
*Helper to check for protocol conflicts.*

### 16.330.1 Detailed Description

[Class](#) that abstracts framebuffers.

A framebuffer is the pixel data that is displayed on a screen and a [Goos](#) object lets the user manipulate that data. A [Goos](#) makes use of two kinds of objects:

- Buffers in the form of [L4Re::Dataspace](#) objects. These hold the bytes for the pixel data.
- [L4Re::Video::View](#) objects.

Both can either be static, that is their number and configuration is fixed and determined by the framebuffer, or they can be dynamic, with the user allocating them.

Definition at line [223](#) of file [goos](#).

### 16.330.2 Member Enumeration Documentation

#### 16.330.2.1 Flags

enum [L4Re::Video::Goos::Flags](#)

[Flags](#) for a [Goos](#).

#### Enumerator

<code>F_auto_refresh</code>	The graphics display is automatically refreshed.
<code>F_pointer</code>	We have a mouse pointer.
<code>F_dynamic_views</code>	Supports dynamically allocated views.
<code>F_dynamic_buffers</code>	Supports dynamically allocated buffers.

Definition at line [228](#) of file [goos](#).

### 16.330.3 Member Function Documentation

#### 16.330.3.1 `create_buffer()`

```
long L4Re::Video::Goos::create_buffer (
    unsigned long size,
    L4::Ipc::Out< L4::Cap< L4Re::Dataspace > > rbuf)
```

Create a buffer.

#### Parameters

---

<i>size</i>	Size of buffer in bytes.
<i>rbuf</i>	Capability slot to point the buffer dataspace to.

### Return values

$\geq 0$	Success, the value returned is the buffer index.
$< 0$	Error

Referenced by [get\\_static\\_buffer\(\)](#).

Here is the caller graph for this function:

### 16.330.3.2 create\_view()

```
int L4Re::Video::Goos::create_view (
    View * view,
    l4_utcb_t * utcb = l4_utcb()) const [inline], [noexcept]
```

Create a view.

### Parameters

out	<i>view</i>	A view object.
	<i>utcb</i>	UTCB of the caller. This is a default parameter.

### Return values

$\geq 0$	Success, the value returned is the view index.
$< 0$	Error

Definition at line 312 of file [goos](#).

References [L4::Kobject\\_t< Goos, L4::Kobject, L4RE\\_PROTO\\_GOOS >::c\(\)](#), [L4::Kobject::cap\(\)](#), and [view\(\)](#).

Here is the caller graph for this function:

#### 16.330.3.4 delete\_view()

```
int L4Re::Video::Goos::delete_view (
    View const & v,
    l4_utcb_t * utcb = l4_utcb()) const [inline], [noexcept]
```

Delete a view.

##### Parameters

<i>v</i>	The view object to delete.
<i>utcb</i>	UTCB of the caller. This is a default parameter.

##### Return values

0	Success
<0	Error

Definition at line 332 of file `goos`.

References `L4::Kobject_t< Goos, L4::Kobject, L4RE_PROTO_GOOS >::c()`.

Here is the call graph for this function:

### 16.330.3.5 get\_static\_buffer()

```
long L4Re::Video::Goos::get_static_buffer (
    unsigned idx,
    L4::Ipc::Out< L4::Cap< L4Re::Dataspace > > rbuf)
```

Return a static buffer of a [Goos](#).

#### Parameters

<i>idx</i>	Index of the static buffer.
<i>rbuf</i>	Capability slot to point the buffer dataspace to.

#### Return values

0	Success
<0	Error

References [create\\_buffer\(\)](#).

Here is the caller graph for this function:

### 16.330.3.6 info()

```
long L4Re::Video::Goos::info (
    Info * info)
```

Return the [Goos](#) information of the [Goos](#).

#### Parameters

out	info	<a href="#">Goos</a> information structure pointer.
-----	------	---

#### Return values

0	Success
<0	Error

References [get\\_static\\_buffer\(\)](#), and [info\(\)](#).

Referenced by [info\(\)](#), and [refresh\(\)](#).

Here is the call graph for this function:

Here is the caller graph for this function:

### 16.330.3.7 view()

```
View L4Re::Video::Goos::view (
    unsigned index) const [inline], [noexcept]
```

Return a view.

#### Parameters

<i>index</i>	Index of the view to return.
--------------	------------------------------

#### Returns

The view.

Definition at line 363 of file [goos](#).

References [L4::Kobject::cap\(\)](#).

### 16.332.1 Detailed Description

Pixel information.

This class wraps the information on a pixel, such as the size and position of each color component in the pixel.

Definition at line 94 of file [colors](#).

## 16.332.2 Constructor & Destructor Documentation

### 16.332.2.1 Pixel\_info() [1/2]

```
L4Re::Video::Pixel_info::Pixel_info (  
    unsigned char bpp,  
    char r,  
    char rs,  
    char g,  
    char gs,  
    char b,  
    char bs,  
    char a = 0,  
    char as = 0) [inline]
```

Constructor.

#### Parameters

<i>bpp</i>	Size of pixel in bytes.
<i>r</i>	Red component size.
<i>rs</i>	Red component shift.
<i>g</i>	Green component size.
<i>gs</i>	Green component shift.
<i>b</i>	Blue component size.
<i>bs</i>	Blue component shift.
<i>a</i>	Alpha component size, defaults to 0.
<i>as</i>	Alpha component shift, defaults to 0.

Definition at line 212 of file [colors](#).

References [a\(\)](#), [b\(\)](#), [g\(\)](#), and [r\(\)](#).

Here is the call graph for this function:

### 16.332.2.2 Pixel\_info() [2/2]

```
template<typename VBI>
L4Re::Video::Pixel_info::Pixel_info (
    VBI const * vbi) [inline], [explicit]
```

Convenience constructor.

#### Parameters

<i>vbi</i>	Suitable information structure. Convenience constructor to create the pixel info from a VESA Framebuffer Info.
------------	--

Definition at line 224 of file [colors](#).

References [bits\\_per\\_pixel\(\)](#).

### 16.332.3 Member Function Documentation

#### 16.332.3.1 a() [1/2]

```
Color_component const & L4Re::Video::Pixel_info::a () const [inline]
```

Return the alpha color compoment of the pixel.

##### Returns

Alpha color component.

Definition at line 123 of file [colors](#).

Referenced by [dump\(\)](#), and [Pixel\\_info\(\)](#).

Here is the caller graph for this function:

#### 16.332.3.2 a() [2/2]

```
void L4Re::Video::Pixel_info::a (
    Color_component const & c) [inline]
```

Set the alpha color component of the pixel.

##### Parameters

<code>c</code>	Alpha color component.
----------------	------------------------

Definition at line 187 of file [colors](#).

### 16.332.3.3 b() [1/2]

```
Color_component const & L4Re::Video::Pixel_info::b () const [inline]
```

Return the blue color compoment of the pixel.

#### Returns

Blue color component.

Definition at line 117 of file [colors](#).

Referenced by [dump\(\)](#), and [Pixel\\_info\(\)](#).

Here is the caller graph for this function:

### 16.332.3.4 b() [2/2]

```
void L4Re::Video::Pixel_info::b (  
    Color_component const & c) [inline]
```

Set the blue color component of the pixel.

#### Parameters

<code>c</code>	Blue color component.
----------------	-----------------------

Definition at line 181 of file [colors](#).

### 16.332.3.5 bits\_per\_pixel()

```
unsigned char L4Re::Video::Pixel_info::bits_per_pixel () const [inline]
```

Number of bits of the pixel.

#### Returns

Number of bits used by the pixel.

Definition at line 156 of file [colors](#).

Referenced by [Pixel\\_info\(\)](#).

Here is the caller graph for this function:

### 16.332.3.6 bytes\_per\_pixel() [1/2]

```
unsigned char L4Re::Video::Pixel_info::bytes_per_pixel () const [inline]
```

Query size of pixel in bytes.

#### Returns

Size of pixel in bytes.

Definition at line 150 of file [colors](#).

Referenced by [dump\(\)](#).

Here is the caller graph for this function:

### 16.332.3.7 bytes\_per\_pixel() [2/2]

```
void L4Re::Video::Pixel_info::bytes_per_pixel (  
    unsigned char bpp) [inline]
```

Set the size of the pixel in bytes.

#### Parameters

<i>bpp</i>	Size of pixel in bytes.
------------	-------------------------

Definition at line 193 of file [colors](#).

### 16.332.3.8 dump()

```
template<typename OUT>
void L4Re::Video::Pixel_info::dump (
    OUT & s) const [inline]
```

Dump information on the pixel to a stream.

#### Parameters

<i>s</i>	Stream
----------	--------

Definition at line 246 of file [colors](#).

References [a\(\)](#), [b\(\)](#), [bytes\\_per\\_pixel\(\)](#), [g\(\)](#), and [r\(\)](#).

Here is the call graph for this function:

**16.332.3.9 g() [1/2]**

```
Color_component const & L4Re::Video::Pixel_info::g () const [inline]
```

Return the green color component of the pixel.

**Returns**

Green color component.

Definition at line 111 of file [colors](#).

Referenced by [dump\(\)](#), and [Pixel\\_info\(\)](#).

Here is the caller graph for this function:

**16.332.3.10 g() [2/2]**

```
void L4Re::Video::Pixel_info::g (
    Color_component const & c) [inline]
```

Set the green color component of the pixel.

**Parameters**

<code>c</code>	Green color component.
----------------	------------------------

Definition at line 175 of file [colors](#).

**16.332.3.11 has\_alpha()**

```
bool L4Re::Video::Pixel_info::has_alpha () const [inline]
```

Return whether the pixel has an alpha channel.

**Returns**

True if the pixel has an alpha channel, false if not.

Definition at line 163 of file [colors](#).

### 16.332.3.12 operator==( )

```
bool L4Re::Video::Pixel_info::operator== (
    Pixel_info const & o) const [inline]
```

Compare for complete equality of the color space.

#### Parameters

<i>o</i>	A <a href="#">Pixel_info</a> to compare to.
----------	---

#### Returns

true if the both [Pixel\\_info](#)'s are equal, false if not.

Definition at line [236](#) of file [colors](#).

References [Pixel\\_info\(\)](#).

Here is the call graph for this function:

### 16.332.3.13 padding()

```
Color_component const L4Re::Video::Pixel_info::padding () const [inline]
```

Compute the padding pseudo component.

The padding pseudo component represents the tailing bits that are reserved in RGB32 and similar pixel formats.

#### Returns

Padding pseudo component.

Definition at line [131](#) of file [colors](#).

**16.332.3.14** `r()` [1/2]

```
Color_component const & L4Re::Video::Pixel_info::r () const [inline]
```

Return the red color component of the pixel.

**Returns**

Red color component.

Definition at line 105 of file [colors](#).

Referenced by [dump\(\)](#), and [Pixel\\_info\(\)](#).

Here is the caller graph for this function:

**16.332.3.15** `r()` [2/2]

```
void L4Re::Video::Pixel_info::r (
    Color_component const & c) [inline]
```

Set the red color component of the pixel.

**Parameters**

<code>c</code>	Red color component.

*Push this view the back.*
- int [refresh](#) (int x, int y, int w, int h) const noexcept  
*Refresh/Redraw the view.*
- bool [valid](#) () const  
*Return whether this view is valid.*

### 16.333.1 Detailed Description

[View](#) of a framebuffer.

A view is a rectangular subset of a framebuffer managed by a [Goos](#) object. The [Goos](#) orders multiple views in a stack which determines which view is on top in case they overlap. The view's pixel data is provided by a backing buffer, which must belong to the [Goos](#). It can be static or dynamically allocated, depending on the framebuffer.

Definition at line 39 of file [goos](#).

### 16.333.2 Member Enumeration Documentation

#### 16.333.2.1 Flags

enum [L4Re::Video::View::Flags](#)

[Flags](#) on a view.

#### Enumerator

F_none	everything for this view is static (the VESA-FB case)
F_set_buffer	buffer object for this view can be changed
F_set_buffer_offset	buffer offset can be set
F_set_bytes_per_line	bytes per line can be set
F_set_pixel	pixel type can be set
F_set_position	position on screen can be set
F_dyn_allocated	<a href="#">View</a> is dynamically allocated.
F_set_background	Set view as background for session.

<code>F_set_flags</code>	Set view flags (.  See also <a href="#">V_flags</a> )
<code>F_fully_dynamic</code>	<a href="#">Flags</a> for a fully dynamic view.

Definition at line 59 of file [goos](#).

### 16.333.2.2 V\_flags

```
enum L4Re::Video::View::V_flags
```

Property flags of a view.

Such flags can be set or deleted with the [F\\_set\\_flags](#) operation using the [set\\_info\(\)](#) method.

#### Enumerator

<code>F_above</code>	Flag the view as stay on top.
<code>F_flags_mask</code>	Mask containing all possible property flags.

Definition at line 82 of file [goos](#).

## 16.333.3 Member Function Documentation

### 16.333.3.1 info()

```
int L4Re::Video::View::info (
    Info * info) const [inline], [noexcept]
```

Return the view information of the view.

#### Parameters

<code>out</code>	<code>info</code>	Information structure pointer.
------------------	-------------------	--------------------------------

#### Return values

<code>0</code>	Success
<code>&lt;0</code>	Error

Definition at line 367 of file [goos](#).

References [info\(\)](#).

Referenced by [info\(\)](#), and [set\\_info\(\)](#).

### 16.333.3.2 refresh()

```

int L4Re::Video::View::refresh (
    int x,
    int y,
    int w,
    int h) const [inline], [noexcept]
  
```

Refresh/Redraw the view.

#### Parameters

<i>x</i>	X position.
<i>y</i>	Y position.
<i>w</i>	Width.
<i>h</i>	Height.

#### Return values

0	Success
<0	Error

Definition at line [379](#) of file [goos](#).

### 16.333.3.3 set\_info()

```
int L4Re::Video::View::set_info (  
    Info const & info) const [inline], [noexcept]
```

Set the information structure for this view.

#### Parameters

<i>info</i>	Information structure.
-------------	------------------------

#### Return values

0	Success
<0	Error

The function will also set the view port according to the values given in the information structure.

Definition at line 371 of file [goos](#).

References [info\(\)](#).

Referenced by [set\\_viewport\(\)](#).

### 16.333.3.4 set\_viewport()

```
int L4Re::Video::View::set_viewport (
    int scr_x,
    int scr_y,
    int w,
    int h,
    unsigned long buf_offset) const [inline], [noexcept]
```

Set the position of the view in the [Goos](#).

#### Parameters

<i>scr_x</i>	X position
<i>scr_y</i>	Y position
<i>w</i>	Width
<i>h</i>	Height
<i>buf_offset</i>	Offset in the buffer in bytes

#### Return values

0	Success
<0	Error

Definition at line 383 of file [goos](#).

### 16.333.3.5 stack()

```
int L4Re::Video::View::stack (
    View const & pivot,
    bool behind = true) const [inline], [noexcept]
```

Move this view in the view stack.

#### Parameters

<i>pivot</i>	<a href="#">View</a> to move relative to
<i>behind</i>	When true move the view behind the pivot view, if false move the view before the pivot view.

#### Return values

0	Success
<0	Error

Definition at line 375 of file [goos](#).

Referenced by [push\\_bottom\(\)](#), and [push\\_top\(\)](#).

*Create an entry with the name n, capability c, and flags f.*

### Data Fields

- [l4\\_cap\\_idx\\_t](#) cap  
*The capability selector for the object.*
- [l4\\_umword\\_t](#) flags  
*Flags for the object.*
- char **name** [16]  
*The name of the object.*

### 16.340.1 Detailed Description

Entry in the [L4Re](#) environment array for the named initial objects.

Definition at line 39 of file [env.h](#).

### 16.340.2 Constructor & Destructor Documentation

#### 16.340.2.1 `l4re_env_cap_entry_t()`

```
l4re_env_cap_entry_t::l4re_env_cap_entry_t (
    char const * n,
    l4_cap_idx_t c,
    l4_umword_t f = 0) [inline]
```

Create an entry with the name *n*, capability *c*, and flags *f*.

#### Parameters

<i>n</i>	is the name of the initial object.
<i>c</i>	is the capability selector that refers the initial object.
<i>f</i>	are the additional flags for the object.

Definition at line 70 of file [env.h](#).

References [cap](#), [flags](#), [L4\\_NOTHROW](#), and [name](#).

### 16.340.3 Field Documentation

#### 16.340.3.1 `flags`

```
l4_umword_t l4re_env_cap_entry_t::flags
```

Flags for the object.

#### Note

Currently unused, except as an end marker for the entry list.

Definition at line 50 of file [env.h](#).

Referenced by [l4re\\_env\\_cap\\_entry\\_t\(\)](#), [l4re\\_env\\_cap\\_entry\\_t\(\)](#), and [l4re\\_env\\_get\\_cap\\_l\(\)](#).

### 16.358.1 Detailed Description

VBE mode information.

Definition at line 125 of file [mb\\_info.h](#).

The documentation for this struct was generated from the following file:

- [l4/util/mb\\_info.h](#)

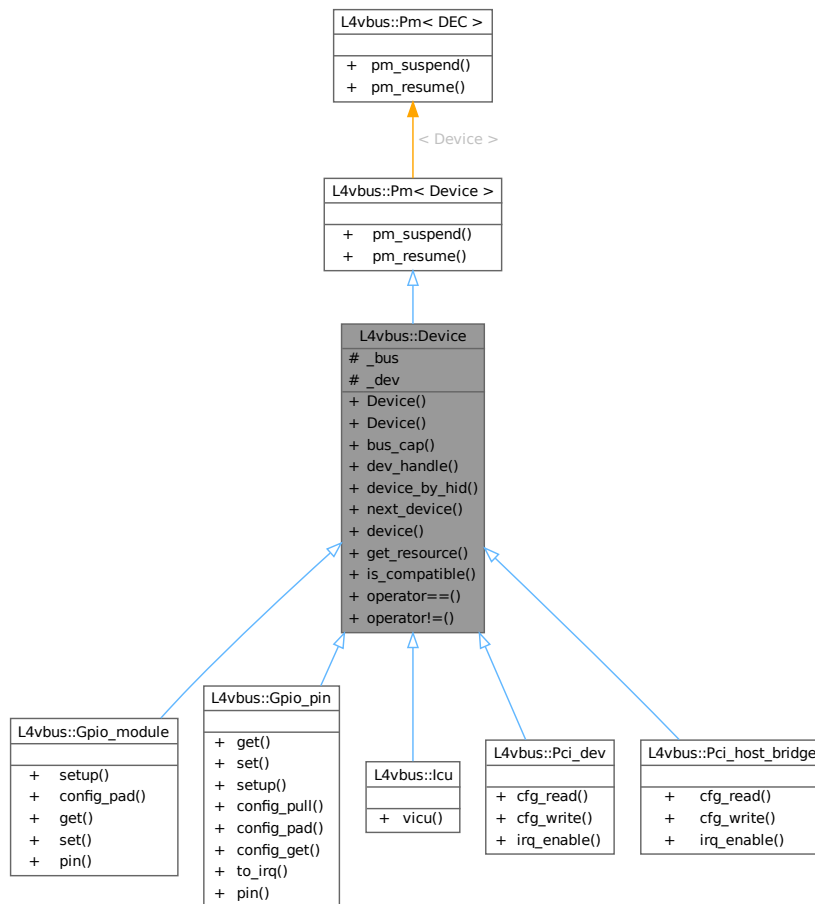

## 16.359 L4vbus::Device Class Reference

Device on a [L4vbus::Vbus](#).

```
#include <vbus>
```

Inheritance diagram for L4vbus::Device:

Collaboration diagram for L4vbus::Device:

## Public Member Functions

- **Device ( )**  
Construct a new vbus device using the NULL device `L4VBUS_NULL`.
- **Device (L4::Cap< Vbus > bus, l4vbus\_device\_handle\_t dev)**  
Construct a new vbus device using a device handle.
- **L4::Cap< Vbus > bus\_cap ( ) const**

- Access the [Vbus](#) capability of the underlying virtual bus.

  - [l4vbus\\_device\\_handle\\_t dev\\_handle](#) () const

Access the device handle of this device.
- int [device\\_by\\_hid](#) ([Device](#) \*child, char const \*hid, int depth=L4VBUS\_MAX\_DEPTH, [l4vbus\\_device\\_t](#) \*devinfo=0) const

Find a device by the hardware interface identifier (HID).
- int [next\\_device](#) ([Device](#) \*child, int depth=L4VBUS\_MAX\_DEPTH, [l4vbus\\_device\\_t](#) \*devinfo=0) const

Find next child following *child*.
- int [device](#) ([l4vbus\\_device\\_t](#) \*devinfo) const

Obtain detailed information about a [Vbus](#) device.
- int [get\\_resource](#) (unsigned res\_idx, [l4vbus\\_resource\\_t](#) \*res) const

Obtain the resource description of an individual device resource.
- int [is\\_compatible](#) (char const \*cid) const

Check if the given device has a compatibility ID (CID) or HID that matches *cid*.
- bool [operator==](#) ([Device](#) const &o) const

Test if two devices are the same [Vbus](#) device.
- bool [operator!=](#) ([Device](#) const &o) const

Test if two [Vbus](#) devices are not the same.

## Public Member Functions inherited from [L4vbus::Pm](#)< [Device](#) >

- int [pm\\_suspend](#) () const

Suspend the device.
- int [pm\\_resume](#) () const

Resume the device.

## Protected Attributes

- [L4::Cap](#)< [Vbus](#) > [\\_bus](#)
- The [Vbus](#) capability where this device is located on.
- [l4vbus\\_device\\_handle\\_t](#) [\\_dev](#)
- The device handle for this device.

## 16.359.1 Detailed Description

[Device](#) on a [L4vbus::Vbus](#).

Definition at line 83 of file [vbus](#).

## 16.359.2 Constructor & Destructor Documentation

### 16.359.2.1 Device()

```
L4vbus::Device::Device (
    L4::Cap< Vbus > bus,
    l4vbus\_device\_handle\_t dev) [inline]
```

Construct a new vbus device using a device handle.

Specifying the special root bus device handle [L4VBUS\\_ROOT\\_BUS](#) forms the root device of the corresponding vbus, see [Vbus::root](#).

## Parameters

<i>bus</i>	The vbus capability where this device is assigned.
<i>dev</i>	The device handle of the device.

Definition at line 100 of file [vbus](#).

References [\\_bus](#), and [\\_dev](#).

### 16.359.3 Member Function Documentation

#### 16.359.3.1 bus\_cap()

```
L4::Cap< Vbus > L4vbus::Device::bus_cap () const [inline]
```

Access the [Vbus](#) capability of the underlying virtual bus.

##### Returns

the capability to the underlying [Vbus](#).

Definition at line 107 of file [vbus](#).

References [\\_bus](#).

Referenced by [L4vbus::Pci\\_dev::cfg\\_read\(\)](#), [L4vbus::Pci\\_host\\_bridge::cfg\\_read\(\)](#), [L4vbus::Pci\\_dev::cfg\\_write\(\)](#), [L4vbus::Pci\\_host\\_bridge::cfg\\_write\(\)](#), [L4vbus::Pci\\_dev::irq\\_enable\(\)](#), and [L4vbus::Pci\\_host\\_bridge::irq\\_enable\(\)](#).

Here is the caller graph for this function:

### 16.359.3.2 dev\_handle()

```
l4vbus_device_handle_t L4vbus::Device::dev_handle () const [inline]
```

Access the device handle of this device.

#### Returns

the device handle for this device.

The device handle is used to directly address the device on its virtual bus.

Definition at line 116 of file [vbus](#).

References [\\_dev](#).

### 16.359.3.3 device()

```
int L4vbus::Device::device (  
    l4vbus_device_t * devinfo) const [inline]
```

Obtain detailed information about a [Vbus](#) device.

#### Parameters

out	<i>devinfo</i>	Information structure which contains details about the device. The pointer might be NULL.
-----	----------------	---

#### Return values

0	Success.
-L4_ENODEV	No device with the given device handle <i>dev</i> could be found.

Definition at line 189 of file [vbus](#).

References [\\_bus](#), [\\_dev](#), and [l4vbus\\_get\\_device\(\)](#).

Here is the call graph for this function:

### 16.359.3.4 device\_by\_hid()

```
int L4vbus::Device::device_by_hid (
    Device * child,
    char const * hid,
    int depth = L4VBUS_MAX_DEPTH,
    l4vbus_device_t * devinfo = 0) const [inline]
```

Find a device by the hardware interface identifier (HID).

This function searches the vbus for a device with the given HID and returns a handle to the first matching device. The HID usually conforms to an ACPI HID or a Linux device tree compatible identifier.

It is possible to have multiple devices with the same HID on a vbus. In order to find all matching devices this function has to be called repeatedly with `child` pointing to the device found in the previous iteration. The iteration starts at `child` that might be any device node in the tree.

#### Parameters

in, out	<i>child</i>	Handle of the device from where in the device tree the search should start. To start searching from the beginning <code>child</code> must be initialized using the default ( <a href="#">L4VBUS_NULL</a> ). If a matching device is found, its handle is returned through this parameter.
	<i>hid</i>	HID of the device
	<i>depth</i>	Maximum depth for the recursive lookup
out	<i>devinfo</i>	<a href="#">Device</a> information structure (might be NULL)

#### Return values

<code>&gt;=0</code>	A device with the given HID was found.
<code>-L4_ENOENT</code>	No device with the given HID could be found on the vbus.
<code>-L4_EINVAL</code>	Invalid or no HID provided.
<code>-L4_ENODEV</code>	Function called on a non-existing device.

Definition at line [148](#) of file [vbus](#).

References [\\_bus](#), [\\_dev](#), [Device\(\)](#), and [l4vbus\\_get\\_device\\_by\\_hid\(\)](#).

Here is the call graph for this function:

### 16.359.3.5 get\_resource()

```
int L4vbus::Device::get_resource (
    unsigned res_idx,
    l4vbus_resource_t * res) const [inline]
```

Obtain the resource description of an individual device resource.

#### Parameters

	<i>res_idx</i>	Index of the resource for which the resource description should be returned. The total number of resources for a device is available in the <a href="#">l4vbus_device_t</a> structure that is returned by <a href="#">L4vbus::Device::device_by_hid()</a> and <a href="#">L4vbus::Device::next_device()</a> .
out	<i>res</i>	Descriptor of the resource.

This function returns the resource descriptor of an individual device resource selected by the *res\_idx* parameter.

#### Return values

0	Success.
-L4_ENOENT	Invalid resource index <i>res_idx</i> .

Definition at line 209 of file [vbus](#).

References [\\_bus](#), [\\_dev](#), and [l4vbus\\_get\\_resource\(\)](#).

Here is the call graph for this function:

### 16.359.3.6 is\_compatible()

```
int L4vbus::Device::is_compatible (
    char const * cid) const [inline]
```

Check if the given device has a compatibility ID (CID) or HID that matches *cid*.

#### Parameters

<i>cid</i>	the compatibility ID to test
------------	------------------------------

**Returns**

1 when the given ID (*cid*) matches this device, 0 when the given ID does not match, <0 on error.

Definition at line 223 of file [vbus](#).

References [\\_bus](#), [\\_dev](#), and [l4vbus\\_is\\_compatible\(\)](#).

Here is the call graph for this function:

**16.359.3.7 next\_device()**

```

int L4vbus::Device::next_device (
    Device * child,
    int depth = L4VBUS_MAX_DEPTH,
    l4vbus_device_t * devinfo = 0) const [inline]
  
```

Find next child following *child*.

**Parameters**

in, out	<i>child</i>	Handle of the device that precedes the device that shall be returned. To start from the beginning, <i>child</i> must be initialized with <a href="#">L4VBUS_NULL</a> ( <a href="#">Device::Device</a> ). If a device is found, its handle is returned through this parameter.
	<i>depth</i>	Depth to look for
out	<i>devinfo</i>	<a href="#">Device</a> information (might be NULL)

**Returns**

0 on success, else failure

Definition at line 171 of file [vbus](#).

References [\\_bus](#), [\\_dev](#), [Device\(\)](#), and [l4vbus\\_get\\_next\\_device\(\)](#).

Here is the call graph for this function:

### 16.359.3.8 `operator!=()`

```
bool L4vbus::Device::operator!= (
    Device const & o) const [inline]
```

Test if two [Vbus](#) devices are not the same.

#### Returns

true if the two devices are different, false else.

Definition at line [239](#) of file [vbus](#).

References [\\_bus](#), [\\_dev](#), and [Device\(\)](#).

Here is the call graph for this function:

### 16.359.3.9 `operator==()`

```
bool L4vbus::Device::operator== (
    Device const & o) const [inline]
```

Test if two devices are the same [Vbus](#) device.

#### Returns

true if the two devices are the same, false else.

Definition at line 230 of file [vbus](#).

References [\\_bus](#), [\\_dev](#), and [Device\(\)](#).

Here is the call graph for this function:

### 16.360.1 Detailed Description

A [Gpio\\_module](#) groups multiple GPIO pins together.

Definition at line 133 of file [vbus\\_gpio](#).

### 16.360.2 Member Function Documentation

#### 16.360.2.1 config\_pad()

```
int L4vbus::Gpio_module::config_pad (
    Pin_slice const & mask,
    unsigned func,
    unsigned value) const [inline]
```

Hardware specific configuration function for multiple GPIO pins.

#### Parameters

<i>mask</i>	Mask of GPIO pins to configure. A bit set to 1 configures this pin. A maximum of 32 pins can be configured at once. The real number depends on the hardware and the driver implementation.
<i>func</i>	Hardware specific configuration register, usually offset to the GPIO chip's base address.
<i>value</i>	Value which is written into the hardware specific configuration register for the specified pins

#### Returns

0 if OK, error code otherwise

Definition at line 185 of file [vbus\\_gpio](#).

References [L4vbus::Device::\\_bus](#), [L4vbus::Device::\\_dev](#), and [l4vbus\\_gpio\\_multi\\_config\\_pad\(\)](#).

Here is the call graph for this function:

#### 16.360.2.2 get()

```
int L4vbus::Gpio_module::get (
    unsigned offset,
    unsigned * data) const [inline]
```

Read values of multiple GPIO pins at once.

#### Parameters

	<i>offset</i>	Pin corresponding to the LSB in <i>data</i> . Note: allowed may be hardware specific.
out	<i>data</i>	Each bit returns the value (0 or 1) for the corresponding GPIO pin. The value of pins that are not accessible is undefined.

#### Returns

0 if OK, error code otherwise

Definition at line 201 of file [vbus\\_gpio](#).

References [L4vbus::Device::\\_bus](#), [L4vbus::Device::\\_dev](#), and [l4vbus\\_gpio\\_multi\\_get\(\)](#).

Here is the call graph for this function:

#### 16.360.2.3 pin()

```
Gpio_pin L4vbus::Gpio_module::pin (  
    unsigned pin) const [inline]
```

Get [Gpio\\_pin](#) for a specific pin of this [Gpio\\_module](#).

#### Parameters

<i>pin</i>	GPIO pin number to get <a href="#">Gpio_pin</a> for.
------------	--

#### Returns

[Gpio\\_pin](#)

Definition at line 229 of file [vbus\\_gpio](#).

References [pin\(\)](#).

Referenced by [pin\(\)](#).

Here is the call graph for this function:

Here is the caller graph for this function:

#### 16.360.2.4 set()

```
int L4vbus::Gpio_module::set (  
    Pin_slice const & mask,  
    unsigned data) [inline]
```

Set multiple GPIO output pins at once.

##### Parameters

<i>mask</i>	Mask of GPIO pins to set. A bit set to 1 selects this pin. A maximum of 32 pins can be set at once. The real number depends on the hardware and the driver implementation.
<i>data</i>	Each bit corresponds to the GPIO pin in <i>mask</i> . The value of each bit is written to the GPIO pin if its bit in <i>mask</i> is set.

##### Returns

0 if OK, error code otherwise

Definition at line 217 of file `vbus_gpio`.

References `L4vbus::Device::_bus`, `L4vbus::Device::_dev`, and `l4vbus_gpio_multi_set()`.

Here is the call graph for this function:

### 16.360.2.5 setup()

```
int L4vbus::Gpio_module::setup (
    Pin_slice const & mask,
    unsigned mode,
    unsigned value) const [inline]
```

Configure function of multiple GPIO pins at once.

#### Parameters

<i>mask</i>	Mask of GPIO pins to configure. A bit set to 1 configures this pin. A maximum of 32 pins can be configured at once. The real number depends on the hardware and the driver implementation.
<i>mode</i>	GPIO function, see <a href="#">L4vbus_gpio_generic_func</a> for generic functions. Hardware specific functions must be provided in the lower 8 bits.
<i>value</i>	Optional value to set the GPIO pins to if they are configured as output pins

#### Returns

0 if OK, error code otherwise

Definition at line 166 of file [vbus\\_gpio](#).

References [L4vbus::Device::\\_bus](#), [L4vbus::Device::\\_dev](#), and [l4vbus\\_gpio\\_multi\\_setup\(\)](#).

## 16.362.1 Detailed Description

A GPIO pin.

Definition at line 26 of file [vbus\\_gpio](#).

## 16.362.2 Member Function Documentation

### 16.362.2.1 `config_get()`

```
int L4vbus::Gpio_pin::config_get (  
    unsigned func,  
    unsigned * value) const [inline]
```

Read hardware specific configuration.

#### Parameters

	<i>func</i>	Hardware specific configuration register to read from. Usually this is an offset to the GPIO chip's base address.
out	<i>value</i>	The configuration value.

#### Returns

0 if OK, error code otherwise

Definition at line 102 of file [vbus\\_gpio](#).

References [L4vbus::Device::\\_bus](#), [L4vbus::Device::\\_dev](#), and [l4vbus\\_gpio\\_config\\_get\(\)](#).

Here is the call graph for this function:

### 16.362.2.2 config\_pad()

```
int L4vbus::Gpio_pin::config_pad (  
    unsigned func,  
    unsigned value) const [inline]
```

Hardware specific configuration function.

#### Parameters

---

<i>func</i>	Hardware specific configuration register, usually offset to the GPIO chip's base address
<i>value</i>	Value which is written into the hardware specific configuration register for the specified pin

#### Returns

0 if OK, error code otherwise

Definition at line 89 of file [vbus\\_gpio](#).

References [L4vbus::Device::\\_bus](#), [L4vbus::Device::\\_dev](#), and [l4vbus\\_gpio\\_config\\_pad\(\)](#).

Here is the call graph for this function:

#### 16.362.2.3 config\_pull()

```
int L4vbus::Gpio_pin::config_pull (  
    unsigned mode) const [inline]
```

Generic function to set pull up/down mode.

#### Parameters

<i>mode</i>	mode for pull up/down resistors, see <a href="#">L4vbus_gpio_pull_modes</a>
-------------	---

#### Returns

0 if OK, error code otherwise

Definition at line 75 of file [vbus\\_gpio](#).

References [L4vbus::Device::\\_bus](#), [L4vbus::Device::\\_dev](#), and [l4vbus\\_gpio\\_config\\_pull\(\)](#).

Here is the call graph for this function:

#### 16.362.2.4 get()

```
int L4vbus::Gpio_pin::get () const [inline]
```

Read value of GPIO input pin.

##### Returns

Value of GPIO pin (usually 0 or 1), negative error code otherwise.

Definition at line 38 of file [vbus\\_gpio](#).

References [L4vbus::Device::\\_bus](#), [L4vbus::Device::\\_dev](#), and [l4vbus\\_gpio\\_get\(\)](#).

Here is the call graph for this function:

#### 16.362.2.5 pin()

```
unsigned L4vbus::Gpio_pin::pin () const [inline]
```

Get pin number.

##### Returns

GPIO pin number

Definition at line 122 of file [vbus\\_gpio](#).

#### 16.362.2.6 set()

```
int L4vbus::Gpio_pin::set (  
    int value) const [inline]
```

Set GPIO output pin.

##### Parameters

<i>value</i>	Value to write to the GPIO pin (usually 0 or 1)
--------------	---

**Returns**

0 if OK, error code otherwise

Definition at line 49 of file [vbus\\_gpio](#).

References [L4vbus::Device::\\_bus](#), [L4vbus::Device::\\_dev](#), and [l4vbus\\_gpio\\_set\(\)](#).

Here is the call graph for this function:

**16.362.2.7 setup()**

```
int L4vbus::Gpio_pin::setup (  
    unsigned mode,  
    unsigned value) const [inline]
```

Configure the function of a GPIO pin.

**Parameters**

<i>mode</i>	GPIO function, see <a href="#">L4vbus_gpio_generic_func</a> for generic functions. Hardware specific functions must be provided in the lower 8 bits.
<i>value</i>	Optional value to set the GPIO pin to if it is configured as an output pin

**Returns**

0 if OK, error code otherwise

Definition at line 64 of file [vbus\\_gpio](#).

References [L4vbus::Device::\\_bus](#), [L4vbus::Device::\\_dev](#), and [l4vbus\\_gpio\\_setup\(\)](#).

Here is the call graph for this function:

### 16.362.2.8 to\_irq()

```
int L4vbus::Gpio_pin::to_irq () const [inline]
```

Create IRQ for GPIO pin.

#### Returns

IRQ number if OK, negative error code otherwise

Definition at line 112 of file [vbus\\_gpio](#).

References [L4vbus::Device::\\_bus](#), [L4vbus::Device::\\_dev](#), and [l4vbus\\_gpio\\_to\\_irq\(\)](#).

Here is the call graph for this function:

## 16.363.1 Detailed Description

[Vbus](#) Interrupt controller API.

Every [Vbus](#) contains a virtual interrupt control unit that manages the IRQs of the devices on the bus. This class provides access to a capability to an [L4::Icu](#) object which can then be used to interface with the IRQs.

See also

[L4::Icu](#)

Definition at line 260 of file [vbus](#).

## 16.363.2 Member Enumeration Documentation

### 16.363.2.1 Src\_types

```
enum L4vbus::Icu::Src_types
```

Flags that can be used with the ICU on a vbus device.

#### Enumerator

Src_dev_handle	Flag to denote that the value should be interpreted as a device handle. This flag may be used in the <code>source</code> parameter in <a href="#">L4::Icu::msi_info()</a> to denote that the ICU should interpret the source ID as a device handle.
----------------	---

Definition at line 264 of file [vbus](#).

## 16.363.3 Member Function Documentation

### 16.363.3.1 vicu()

```
int L4vbus::Icu::vicu (
    L4::Cap< L4::Icu > icu) const [inline]
```

Request an [L4::Icu](#) capability for this [Vbus](#)'s virtual ICU.

#### Parameters

out	icu	Capability slot where the <a href="#">L4::Icu</a> capability shall be stored.
-----	-----	---

#### Return values

0	Success.
---	----------

<i>otherwise</i>	IPC error.
------------------	------------

Definition at line 285 of file [vbus](#).

### 16.364.1 Detailed Description

A PCI device.

Definition at line 93 of file `vbus_pci`.

## 16.364.2 Member Function Documentation

### 16.364.2.1 `cfg_read()`

```
int L4vbus::Pci_dev::cfg_read (
    14_uint32_t reg,
    14_uint32_t * value,
    14_uint32_t width) const [inline]
```

Read from the device's vPCI configuration space.

#### Parameters

	<i>reg</i>	Register in configuration space to read
out	<i>value</i>	Value that has been read
	<i>width</i>	Width to read in bits (e.g. 8, 16, 32)

#### Returns

0 on success, else failure

Definition at line 105 of file `vbus_pci`.

References `L4vbus::Device::_dev`, `L4vbus::Device::bus_cap()`, and `l4vbus_pcidev_cfg_read()`.

Here is the call graph for this function:

### 16.364.2.2 `cfg_write()`

```
int L4vbus::Pci_dev::cfg_write (
    14_uint32_t reg,
    14_uint32_t value,
    14_uint32_t width) const [inline]
```

Write to the device's vPCI configuration space.

#### Parameters

<i>reg</i>	Register in configuration space to write
<i>value</i>	Value to write
<i>width</i>	Width to write in bits (e.g. 8, 16, 32)

#### Returns

0 on success, else failure

Definition at line 121 of file `vbus_pci`.

References [L4vbus::Device::\\_dev](#), [L4vbus::Device::bus\\_cap\(\)](#), and [l4vbus\\_pciddev\\_cfg\\_write\(\)](#).

Here is the call graph for this function:

#### 16.364.2.3 irq\_enable()

```
int L4vbus::Pci_dev::irq_enable (  
    unsigned char * trigger,  
    unsigned char * polarity) const [inline]
```

Enable the device's PCI interrupt.

#### Parameters

out	<i>trigger</i>	False if interrupt is level-triggered
out	<i>polarity</i>	True if interrupt is of low polarity

#### Returns

On success: Interrupt line to be used, else failure

Definition at line 137 of file [vbus\\_pci](#).

References [L4vbus::Device::\\_dev](#), [L4vbus::Device::bus\\_cap\(\)](#), and [l4vbus\\_pcidev\\_irq\\_enable\(\)](#).

Here is the call graph for this function:

The documentation for this class was generated from the following file:

### 16.365.1 Detailed Description

A Pci host bridge.

Definition at line 25 of file [vbus\\_pci](#).

### 16.365.2 Member Function Documentation

#### 16.365.2.1 `cfg_read()`

```
int L4vbus::Pci_host_bridge::cfg_read (
    l4_uint32_t bus,
    l4_uint32_t devfn,
    l4_uint32_t reg,
    l4_uint32_t * value,
    l4_uint32_t width) const [inline]
```

Read from the vPCI configuration space using the PCI root bridge.

#### Parameters

	<i>bus</i>	Bus number
	<i>devfn</i>	Device id (upper 16bit) and function (lower 16bit)
	<i>reg</i>	Register in configuration space to read
out	<i>value</i>	Value that has been read
	<i>width</i>	Width to read in bits (e.g. 8, 16, 32)

#### Returns

0 on success, else failure

Definition at line 39 of file [vbus\\_pci](#).

References [L4vbus::Device::\\_dev](#), [L4vbus::Device::bus\\_cap\(\)](#), and [l4vbus\\_pci\\_cfg\\_read\(\)](#).

Here is the call graph for this function:

### 16.365.2.2 cfg\_write()

```
int L4vbus::Pci_host_bridge::cfg_write (
    14_uint32_t bus,
    14_uint32_t devfn,
    14_uint32_t reg,
    14_uint32_t value,
    14_uint32_t width) const [inline]
```

Write to the vPCI configuration space using the PCI root bridge.

#### Parameters

<i>bus</i>	Bus number
<i>devfn</i>	<a href="#">Device</a> id (upper 16bit) and function (lower 16bit)
<i>reg</i>	Register in configuration space to write
<i>value</i>	Value to write
<i>width</i>	Width to write in bits (e.g. 8, 16, 32)

#### Returns

0 on success, else failure

Definition at line 58 of file [vbus\\_pci](#).

References [L4vbus::Device::\\_dev](#), [L4vbus::Device::bus\\_cap\(\)](#), and [l4vbus\\_pci\\_cfg\\_write\(\)](#).

Here is the call graph for this function:

### 16.365.2.3 irq\_enable()

```
int L4vbus::Pci_host_bridge::irq_enable (
    14_uint32_t bus,
    14_uint32_t devfn,
    int pin,
    unsigned char * trigger,
    unsigned char * polarity) const [inline]
```

Enable PCI interrupt for a specific device using the PCI root bridge.

#### Parameters

	<i>bus</i>	Bus number
	<i>devfn</i>	<a href="#">Device</a> id (upper 16bit) and function (lower 16bit)
	<i>pin</i>	Interrupt pin (normally as reported in configuration register INTR)
out	<i>trigger</i>	False if interrupt is level-triggered
out	<i>polarity</i>	True if interrupt is of low polarity

### Returns

On success: Interrupt line to be used, else failure

Definition at line 79 of file [vbus\\_pci](#).

References [L4vbus::Device::\\_dev](#), [L4vbus::Device::bus\\_cap\(\)](#), and [l4vbus\\_pci\\_irq\\_enable\(\)](#).

Here is the call graph for this function:

The documentation for this class was generated from the following file:

## 16.366 L4vbus::Pm< DEC > Class Template Reference

Power-management API mixin.

```
#include <vbus>
```

Inheritance diagram for L4vbus::Pm< DEC >:

Collaboration diagram for L4vbus::Pm< DEC >:

## Public Member Functions

- int `pm_suspend()` const  
*Suspend the device.*
- int `pm_resume()` const  
*Resume the device.*

### 16.366.1 Detailed Description

```
template<typename DEC>
class L4vbus::Pm< DEC >
```

Power-management API mixin.

Devices that inherit from this mixin provide an API to be suspended and resumed.

Definition at line 50 of file [vbus](#).

### 16.366.2 Member Function Documentation

#### 16.366.2.1 pm\_resume()

```
template<typename DEC>
int L4vbus::Pm< DEC >::pm_resume () const [inline]
```

Resume the device.

Switches the device from low-power mode to normal operation and restores the saved state.

#### Return values

0	Success.
---	----------

Definition at line 74 of file [vbus](#).

References [l4vbus\\_pm\\_resume\(\)](#).

Here is the call graph for this function:

#### 16.366.2.2 pm\_suspend()

```
template<typename DEC>
int L4vbus::Pm< DEC >::pm_suspend () const [inline]
```

Suspend the device.

Saves the state of the device and puts it into a low-power mode.

#### Return values

0	Success.
---	----------

Definition at line 63 of file [vbus](#).

References [l4vbus\\_pm\\_suspend\(\)](#).

Here is the call graph for this function:

Definition at line [298](#) of file [vbus](#).

**16.367.2 Member Function Documentation****16.367.2.1 `assign_dma_domain()` [1/2]**

```
int L4vbus::Vbus::assign_dma_domain (
    unsigned domain_id,
    unsigned flags,
    L4::Cap< L4::Task > dma_space) const [inline]
```

Bind or unbind a kernel [DMA space](#) to a DMA domain.

**Parameters**

<i>domain_id</i>	DMA domain ID (resource address of DMA domain found on the vBUS). If the value is ~0U the DMA space of the whole vBUS is used.
<i>flags</i>	A combination of <a href="#">L4vbus_dma_domain_assign_flags</a> .
<i>dma_space</i>	The DMA space capability to bind or unbind, this must be a kernel <a href="#">DMA space</a> ( <a href="#">L4::Task</a> created with <code>L4_PROTO_DMA_SPACE</code> )

**Return values**

0	Operation completed successfully.
-L4_ENOENT	The vbus does not support a global DMA domain or no DMA domain could be found.
-L4_EINVAL	Invalid argument used.
-L4_EBUSY	DMA domain is already active, this means another DMA space is already assigned.

Definition at line 382 of file [vbus](#).

References [L4::Cap\\_base::cap\(\)](#), [L4::Kobject::cap\(\)](#), [L4Re::Dataspace::flags\(\)](#), [l4vbus\\_assign\\_dma\\_domain\(\)](#), [L4VBUS\\_DMAD\\_KERNEL\\_DMA\\_SPACE](#), and [L4VBUS\\_DMAD\\_L4RE\\_DMA\\_SPACE](#).

### 16.367.2.2 assign\_dma\_domain() [2/2]

```

int L4vbus::Vbus::assign_dma_domain (
    unsigned domain_id,
    unsigned flags,
    L4::Cap< L4Re::Dma_space > dma_space) const [inline]

```

Bind or unbind an [L4Re::Dma\\_space](#) to a DMA domain.

#### Parameters

<i>domain_id</i>	DMA domain ID (resource address of DMA domain found on the vBUS). If the value is ~0U the DMA space of the whole vBUS is used.
<i>flags</i>	A combination of <a href="#">L4vbus_dma_domain_assign_flags</a> .
<i>dma_space</i>	The DMA space capability to bind or unbind, this must be an <a href="#">L4Re::Dma_space</a>

#### Return values

0	Operation completed successfully.
-L4_ENOENT	The vbus does not support a global DMA domain or no DMA domain could be found.
-L4_EINVAL	Invalid argument used.
-L4_EBUSY	DMA domain is already active, this means another DMA space is already assigned.

Definition at line 357 of file [vbus](#).

Here is the call graph for this function:

### 16.367.2.3 release\_ioport()

```
int L4vbus::Vbus::release_ioport (
    l4vbus_resource_t * res) const [inline]
```

Release the given IO port resource from the bus.

#### Parameters

in	res	The IO port resource to be released from the bus.
----	-----	---

#### Returns

>=0 on success, <0 on error.

Definition at line 323 of file [vbus](#).

References [L4::Kobject::cap\(\)](#), and [l4vbus\\_release\\_ioport\(\)](#).

Here is the call graph for this function:

### 16.367.2.4 request\_ioport()

```
int L4vbus::Vbus::request_ioport (
    l4vbus_resource_t * res) const [inline]
```

Request the given IO port resource from the bus.

#### Parameters

<i>in</i>	<i>res</i>	The IO port resource to be requested from the bus.
-----------	------------	--

**Return values**

<i>0</i>	Success.
<i>-L4_EINVAL</i>	Resource is not an IO port resource.
<i>-L4_ENOENT</i>	No matching IO port resource found.

Definition at line 311 of file [vbus](#).

```
L4vcpu::State::State (
    unsigned v) [inline], [explicit]
```

Initialize state.

#### Parameters

---

<i>v</i>	Initial state.
----------	----------------

Definition at line 34 of file [vcpu](#).

## 16.370.3 Member Function Documentation

### 16.370.3.1 add()

```
void L4vcpu::State::add (  
    unsigned bits) throw ( )    [inline]
```

Add flags.

#### Parameters

<i>bits</i>	Bits to add to the word.
-------------	--------------------------

Definition at line 41 of file [vcpu](#).

### 16.370.3.2 clear()

```
void L4vcpu::State::clear (  
    unsigned bits) throw ( )    [inline]
```

Clear flags.

#### Parameters

<i>bits</i>	Bits to clear in the word.
-------------	----------------------------

Definition at line 48 of file [vcpu](#).

### 16.370.3.3 set()

```
void L4vcpu::State::set (  
    unsigned v) throw ( )    [inline]
```

Set flags.

#### Parameters

<i>v</i>	Set the word to the value of <i>v</i> .
----------	---

Definition at line 55 of file [vcpu](#).

## 16.371.1 Detailed Description

C++ implementation of the vCPU save state area.

Definition at line 65 of file [vcpu](#).

## 16.371.2 Member Function Documentation

### 16.371.2.1 `cast()` [1/2]

```
Vcpu * L4vcpu::Vcpu::cast (
    l4_addr_t x) throw ( )    [inline], [static]
```

Cast an address to a class pointer.

#### Parameters

<i>x</i>	Pointer.
----------	----------

#### Returns

Pointer to [Vcpu](#) class.

Definition at line 269 of file [vcpu](#).

### 16.371.2.2 `cast()` [2/2]

```
Vcpu * L4vcpu::Vcpu::cast (
    void * x) throw ( )    [inline], [static]
```

Cast a void pointer to a class pointer.

#### Parameters

<i>x</i>	Pointer.
----------	----------

**Returns**

Pointer to [Vcpu](#) class.

Definition at line [259](#) of file [vcpu](#).

References [cast\(\)](#).

Referenced by [cast\(\)](#).

Here is the call graph for this function:

Here is the caller graph for this function:

**16.371.2.3 entry\_ip()**

```
void L4vcpu::Vcpu::entry_ip (  
    l4\_umword\_t ip) [inline]
```

Set vCPU entry instruction pointer.

**Parameters**

<i>ip</i>	Instruction pointer address to set.
-----------	-------------------------------------

Definition at line [232](#) of file [vcpu](#).

References [l4\\_vcpu\\_state\\_t::entry\\_ip](#).

#### 16.371.2.4 entry\_sp()

```
void L4vcpu::Vcpu::entry_sp (  
    14_umword_t sp) [inline]
```

Set vCPU entry stack pointer.

##### Parameters

---

<i>sp</i>	Stack pointer address to set.
-----------	-------------------------------

**Note**

The value is only used when entering from a user-task.

Definition at line 225 of file `vcpu`.

References `l4_vcpu_state_t::entry_sp`.

**16.371.2.5 ext\_alloc()**

```
int L4vcpu::Vcpu::ext_alloc (
    Vcpu ** vcpu,
    l4_addr_t * ext_state,
    L4::Cap< L4::Task > task = L4Re::Env::env() ->task(),
    L4::Cap< L4Re::Rm > rm = L4Re::Env::env() ->rm() throw ( )    [static]
```

Allocate state area for an extended vCPU.

**Parameters**

out	<i>vcpu</i>	Allocated vcpu-state area.
out	<i>ext_state</i>	Allocated extended vcpu-state area.
	<i>task</i>	Task to use for allocation, defaults to own task.
	<i>rm</i>	Region manager to use for allocation defaults to standard region manager.

**Returns**

0 for success, error code otherwise

References `L4Re::Env::env()`, and `task()`.

Here is the call graph for this function:

**16.371.2.6 i()** [1/2]

```
l4_vcpu_ipc_regs_t * L4vcpu::Vcpu::i () throw ( ) [inline]
```

Return pointer to IPC state.

**Returns**

Pointer to IPC state.

Definition at line 209 of file [vcpu](#).

References [l4\\_vcpu\\_state\\_t::i](#).

**16.371.2.7 i()** [2/2]

```
l4_vcpu_ipc_regs_t const * L4vcpu::Vcpu::i () const throw ( ) [inline]
```

Return pointer to IPC state.

**Returns**

Pointer to IPC state.

Definition at line 216 of file [vcpu](#).

References [l4\\_vcpu\\_state\\_t::i](#).

**16.371.2.8 irq\_disable\_save()**

```
unsigned L4vcpu::Vcpu::irq_disable_save () throw ( ) [inline]
```

Disable the vCPU for event delivery and return previous state.

**Returns**

IRQ state before disabling IRQs.

Definition at line 78 of file [vcpu](#).

References [l4vcpu\\_irq\\_disable\\_save\(\)](#).

Here is the call graph for this function:

**16.371.2.9 irq\_enable()**

```
void L4vcpu::Vcpu::irq_enable (
    l4_utcb_t * utcb,
    l4vcpu_event_hndl_t do_event_work_cb,
    l4vcpu_setup_ipc_t setup_ipc) throw ( ) [inline]
```

Enable the vCPU for event delivery.

**Parameters**

<i>utcb</i>	The UTCB to use.
<i>do_event_work_cb</i>	Call-back function that is called in case an event (such as an interrupt) is pending.
<i>setup_ipc</i>	Call-back function that is called before an IPC operation is called, and before event delivery is enabled.

Definition at line 135 of file `vcpu`.

References `l4vcpu_irq_enable()`.

Here is the call graph for this function:

### 16.371.2.10 `irq_restore()`

```

void L4vcpu::Vcpu::irq_restore (
    unsigned s,
    l4_utcb_t * utcb,
    l4vcpu_event_hndl_t do_event_work_cb,
    l4vcpu_setup_ipc_t setup_ipc) throw ( )    [inline]
  
```

Restore a previously saved IRQ/event state.

#### Parameters

<i>s</i>	IRQ state to be restored.
<i>utcb</i>	The UTCB to use.
<i>do_event_work_cb</i>	Call-back function that is called in case an event (such as an interrupt) is pending.
<i>setup_ipc</i>	Call-back function that is called before an IPC operation is called, and before event delivery is enabled.

Definition at line 150 of file `vcpu`.

References `l4vcpu_irq_restore()`.

Here is the call graph for this function:

### 16.371.2.11 is\_irq\_entry()

```
int L4vcpu::Vcpu::is_irq_entry () const [inline]
```

Return whether the entry reason was an IRQ/IPC message.

return 0 if not, !=0 otherwise.

Definition at line 188 of file [vcpu](#).

References [l4vcpu\\_is\\_irq\\_entry\(\)](#).

Here is the call graph for this function:

### 16.371.2.12 is\_page\_fault\_entry()

```
int L4vcpu::Vcpu::is_page_fault_entry () const [inline]
```

Return whether the entry reason was a page fault.

return 0 if not, !=0 otherwise.

Definition at line 181 of file [vcpu](#).

References [l4vcpu\\_is\\_page\\_fault\\_entry\(\)](#).

Here is the call graph for this function:

**16.371.2.13** `r()` [1/2]

```
l4_vcpu_regs_t * L4vcpu::Vcpu::r () throw ( ) [inline]
```

Return pointer to register state.

**Returns**

Pointer to register state.

Definition at line 195 of file `vcpu`.

References `l4_vcpu_state_t::r`.

**16.371.2.14** `r()` [2/2]

```
l4_vcpu_regs_t const * L4vcpu::Vcpu::r () const throw ( ) [inline]
```

Return pointer to register state.

**Returns**

Pointer to register state.

Definition at line 202 of file `vcpu`.

References `l4_vcpu_state_t::r`.

**16.371.2.15** `saved_state()` [1/2]

```
State * L4vcpu::Vcpu::saved_state () throw ( ) [inline]
```

Get `saved_state` word.

**Returns**

Pointer to `saved_state` word in the vCPU

Definition at line 106 of file `vcpu`.

References `l4_vcpu_state_t::saved_state`.

**16.371.2.16** `saved_state()` [2/2]

```
State L4vcpu::Vcpu::saved_state () const throw ( ) [inline]
```

Get `saved_state` word.

**Returns**

Pointer to `saved_state` word in the vCPU

Definition at line 116 of file `vcpu`.

References `l4_vcpu_state_t::saved_state`.

**16.371.2.17 state()** [1/2]

```
State * L4vcpu::Vcpu::state () throw ( )    [inline]
```

Get state word.

**Returns**

Pointer to state word in the vCPU

Definition at line 88 of file [vcpu](#).

References [l4\\_vcpu\\_state\\_t::state](#).

**16.371.2.18 state()** [2/2]

```
State L4vcpu::Vcpu::state () const throw ( )    [inline]
```

Get state word.

**Returns**

Pointer to state word in the vCPU

Definition at line 99 of file [vcpu](#).

References [l4\\_vcpu\\_state\\_t::state](#).

**16.371.2.19 task()**

```
void L4vcpu::Vcpu::task (
    L4::Cap< L4::Task > const task = L4::Cap<L4::Task>::Invalid) throw ( )    [inline]
```

Set the task of the vCPU.

**Parameters**

<i>task</i>	Task to set, defaults to invalid task.
-------------	--

Definition at line 174 of file [vcpu](#).

References [L4::Cap\\_base::Invalid](#), [task\(\)](#), and [l4\\_vcpu\\_state\\_t::user\\_task](#).

Referenced by [ext\\_alloc\(\)](#), and [task\(\)](#).

Here is the call graph for this function:

Here is the caller graph for this function:

### 16.371.2.20 wait\_for\_event()

```

void L4vcpu::Vcpu::wait_for_event (
    l4_utcb_t * utcb,
    l4vcpu_event_hndl_t do_event_work_cb,
    l4vcpu_setup_ipc_t setup_ipc) throw ( )    [inline]
  
```

Wait for event.

#### Parameters

<i>utcb</i>	The UTCB to use.
<i>do_event_work_cb</i>	Call-back function that is called in case an event (such as an interrupt) is pending.
<i>setup_ipc</i>	Call-back function that is called before an IPC operation is called.

Note that event delivery remains disabled after this function returns.

Definition at line 166 of file `vcpu`.

References [l4vcpu\\_wait\\_for\\_event\(\)](#).

**16.372.1 Detailed Description**

IPC interface for virtio over [L4](#) IPC.

The [L4virtio](#) protocol is an adaption of the mmio virtio transport 1.0(4). This interface allows to exchange the necessary resources: device configuration page, notification interrupts and dataspace for payload.

Notification interrupts can be configured independently for changes to the configuration space and each queue through special L4virtio-specific `notify_index` fields in the config page and queue configuration. The interface distinguishes between device-to-driver and driver-to-device notification interrupts.

Device-to-driver interrupts are configured via the ICU interface. The device announces the maximum number of supported interrupts via `lcu::info()`. The driver can then bind interrupts using `lcu::bind()`.

Driver-to-device interrupts must be requested from the device through [device\\_notification\\_irq\(\)](#).

Definition at line 39 of file [l4virtio](#).

**16.372.2 Member Function Documentation****16.372.2.1 config\_queue()**

```
long L4virtio::Device::config_queue (
    unsigned queue)
```

Trigger queue configuration of the given queue.

Usually all queues are configured when the status is written to running. However, in some cases queues shall be disabled or enabled dynamically, in this case this function triggers a reconfiguration from the shared memory register of the queue config.

**Parameters**

<i>queue</i>	Queue index for the queue to be configured.
--------------	---

### Return values

0	on success.
-L4_EIO	The queue's status is invalid.
-L4_ERANGE	The queue index exceeds the number of queues.
-L4_EINVAL	Otherwise.

References [config\\_queue\(\)](#), [L4VIRTIO\\_OP\\_REGISTER\\_DS](#), and [register\\_ds\(\)](#).

Referenced by [config\\_queue\(\)](#).

Here is the call graph for this function:

Here is the caller graph for this function:

### 16.372.2.2 device\_config()

```

long L4virtio::Device::device_config (
    L4::Ipc::Out< L4::Cap< L4Re::Dataspace > > config_ds,
    l4_addr_t * ds_offset)

```

Get the dataspace with the [L4virtio](#) configuration page.

### Parameters

<i>config_ds</i>	Capability for receiving the dataspace capability for the shared L4-VIRTIO config data space.
------------------	---

<i>ds_offset</i>	Offset into the dataspace where the device configuration structure starts.
------------------	--

References [device\\_notification\\_irq\(\)](#), and [L4VIRTIO\\_OP\\_GET\\_DEVICE\\_IRQ](#).

Referenced by [register\\_ds\(\)](#).

Here is the call graph for this function:

Here is the caller graph for this function:

### 16.372.2.3 device\_notification\_irq()

```

long L4virtio::Device::device_notification_irq (
    unsigned index,
    L4::Ipc::Out< L4::Cap< L4::Triggerable > > irq)

```

Get the notification interrupt corresponding to the given index.

#### Parameters

	<i>index</i>	Index of the interrupt.
out	<i>irq</i>	Triggerable for the given index.

#### Return values

<i>L4_EOK</i>	Success.
<i>L4_ENOSYS</i>	IRQ notification not supported by device.
<0	Other error.

An index is only guaranteed to return an IRQ object when the index is set in one of the device notify index fields. The device must return the same interrupt for a given index as long as the index is in use. If an index disappears as a result of a configuration change and then is reused later, the interrupt is not guaranteed to be the same.

Interrupts must always be rerequested after a device reset.

Referenced by [device\\_config\(\)](#).

Here is the caller graph for this function:

#### 16.372.2.4 register\_ds()

```

long L4virtio::Device::register_ds (
    L4::Ipc::Cap< L4Re::Dataspace > ds_cap,
    l4_uint64_t base,
    l4_umword_t offset,
    l4_umword_t size)

```

Register a shared data space with VIRTIO host.

##### Parameters

<i>ds_cap</i>	Dataspace capability to register. The lower 8 bits determine the rights mask with which the guest's rights are masked during the registration of the dataspace at the VIRTIO host.
<i>base</i>	VIRTIO guest physical start address of shared memory region
<i>offset</i>	Offset within the data space that is attached to the given <i>base</i> in the guest physical memory.
<i>size</i>	Size of the memory region in the guest

##### Return values

<i>L4_EOK</i>	Operation successful.
<i>-L4_EINVAL</i>	The <i>ds_cap</i> capability is invalid, does not refer to a valid dataspace, is not a trusted dataspace if trusted dataspace validation is enabled, or <i>size</i> and <i>offset</i> specify an invalid region.
<i>-L4_ENOMEM</i>	The limit of dataspaces that can be registered has been reached or no capability slot could be allocated.
<i>-L4_ERANGE</i>	<i>offset</i> is larger than the size of the dataspace.
<i>&lt;0</i>	Any error returned by the dataspace when queried for information during setup or any error returned by the region manager from attaching the dataspace.

References [device\\_config\(\)](#), and [L4VIRTIO\\_OP\\_DEVICE\\_CONFIG](#).

Referenced by [config\\_queue\(\)](#).

Here is the call graph for this function:

Here is the caller graph for this function:

### 16.372.2.5 set\_status()

```
long L4virtio::Device::set_status (
    unsigned status)
```

Write the VIRTIO status register.

#### Parameters

<i>status</i>	Status word to write to the VIRTIO status.
---------------	--

#### Return values

0	on success.
---	-------------

#### Note

All other registers are accessed via shared memory.

References [L4VIRTIO\\_OP\\_CONFIG\\_QUEUE](#), and [set\\_status\(\)](#).

Referenced by [set\\_status\(\)](#).

### 16.373.1 Detailed Description

Simple class for accessing a virtio block device synchronously.

Definition at line 36 of file [virtio-block](#).

### 16.373.2 Member Function Documentation

#### 16.373.2.1 add\_block()

```
int L4virtio::Driver::Block_device::add_block (
    Handle handle,
    Ptr< void > addr,
    l4_uint32_t size) [inline]
```

Add a data block to a request that has already been set up.

#### Parameters

<i>handle</i>	<a href="#">Handle</a> to request previously set up with <a href="#">start_request()</a> .
<i>addr</i>	Address of data block in device address space.
<i>size</i>	Size of data block.

#### Return values

<i>L4_OK</i>	Block was successfully added.
<i>-L4_EAGAIN</i>	No descriptors available. Try again later.

Definition at line 229 of file [virtio-block](#).

References [L4virtio::Virtqueue::Desc::addr](#), [L4virtio::Virtqueue::Desc::flags](#), [L4\\_EAGAIN](#), [L4\\_EOK](#), [L4virtio::Virtqueue::Desc::len](#), [L4virtio::Virtqueue::Desc::Flags::next\(\)](#), [L4virtio::Virtqueue::Desc::next](#), [L4virtio::Virtqueue::Desc::Flags::raw](#), and [L4virtio::Virtqueue::Desc::Flags::write\(\)](#).

Here is the call graph for this function:

### 16.373.2.2 process\_request()

```
int L4virtio::Driver::Block_device::process_request (
    Handle handle) [inline]
```

Process request synchronously.

#### Parameters

<i>handle</i>	Handle to request to process.
---------------	-------------------------------

#### Return values

<i>L4_EOK</i>	Request processed successfully.
<i>-L4_EAGAIN</i>	No descriptors available. Try again later.
<i>-L4_EIO</i>	IO error during request processing.
<i>-L4_ENOSYS</i>	Unsupported request.
<i>&lt;0</i>	Another unspecified error occurred.

Sends a request to the driver that was previously set up with [start\\_request\(\)](#) and [add\\_block\(\)](#) and wait for it to be executed.

Definition at line 306 of file [virtio-block](#).

References [L4virtio::Virtqueue::Desc::addr](#), [L4virtio::Virtqueue::Desc::flags](#), [L4\\_EAGAIN](#), [L4\\_EINVAL](#), [L4\\_EIO](#), [L4\\_ENOSYS](#), [L4\\_EOK](#), [L4VIRTIO\\_BLOCK\\_S\\_IOERR](#), [L4VIRTIO\\_BLOCK\\_S\\_OK](#), [L4VIRTIO\\_BLOCK\\_S\\_UNSUPP](#), [L4virtio::Virtqueue::Desc::len](#), [L4virtio::Virtqueue::Desc::Flags::next\(\)](#), [L4virtio::Virtqueue::Desc::next](#), [L4virtio::Virtqueue::Desc::Flags::write\(\)](#), [L4virtio::Driver::Device::send\\_and\\_wait\(\)](#), and [L4virtio::Virtqueue::Desc::Flags::write\(\)](#).

Here is the call graph for this function:

### 16.373.2.3 process\_used\_queue()

```
void L4virtio::Driver::Block_device::process_used_queue () [inline]
```

Process and free all items in the used queue.

If the request has a callback registered it is called after the item has been removed from the queue.

Definition at line 357 of file [virtio-block](#).

References [L4Re::chksys\(\)](#), and [L4\\_ENOSYS](#).

Here is the call graph for this function:

#### 16.373.2.4 send\_request()

```
int L4virtio::Driver::Block_device::send_request (
    Handle handle) [inline]
```

Process request asynchronously.

##### Parameters

<i>handle</i>	<a href="#">Handle</a> to request to send to the device
---------------	---

##### Return values

<i>L4_OK</i>	Request was successfully scheduled.
<i>-L4_EAGAIN</i>	No descriptors available. Try again later.

Sends a request to the driver that was previously set up with [start\\_request\(\)](#) and [add\\_block\(\)](#) and wait for it to be executed.

Definition at line 265 of file [virtio-block](#).

References [L4virtio::Virtqueue::Desc::addr](#), [L4virtio::Virtqueue::Desc::flags](#), [L4\\_EAGAIN](#), [L4\\_EOK](#), [L4virtio::Virtqueue::Desc::len](#), [L4virtio::Virtqueue::Desc::Flags::next\(\)](#), [L4virtio::Virtqueue::Desc::next](#), [L4virtio::Virtqueue::Desc::Flags::raw](#), [L4virtio::Driver::Device::send\(\)](#), and [L4virtio::Virtqueue::Desc::Flags::write\(\)](#).

Here is the call graph for this function:

## 16.373.2.5 setup\_device()

```
void L4virtio::Driver::Block_device::setup_device (
    L4::Cap< L4virtio::Device > srvcap,
    l4_size_t usermem,
    void ** userdata,
    Ptr< void > & user_devaddr,
    L4::Cap< L4Re::Dataspace > qds = L4::Cap<L4Re::Dataspace>(),
    l4_uint32_t fmask0 = -1U,
    l4_uint32_t fmask1 = -1U) [inline]
```

Establish a connection to the device and set up shared memory.

## Parameters

	<i>srvcap</i>	IPC capability of the channel to the server.
	<i>usermem</i>	Size of additional memory to share with device.
out	<i>userdata</i>	Pointer to the region of user-usable memory.
out	<i>user_devaddr</i>	Address of user-usable memory in device address space.
	<i>qds</i>	External queue dataspace. If this capability is invalid, the function will attempt to allocate a dataspace on its own. Note that the external queue dataspace must be large enough.
	<i>fmask0</i>	Feature bits 0..31 that the driver supports.
	<i>fmask1</i>	Feature bits 32..63 that the driver supports.

This function starts a handshake with the device and sets up the virtqueues for communication and the additional data structures for the block device. It will also allocate and share additional memory that the caller then can use freely, i.e. normally this memory would be used as a reception buffer. The caller may also decide to not make use of this convenience function and request 0 bytes in *usermem*. Then it has to allocate the block buffers for sending/receiving payload manually and share them using [register\\_ds\(\)](#).

Definition at line 92 of file [virtio-block](#).

References [L4Re::chkcap\(\)](#), [L4Re::chksys\(\)](#), [L4virtio::Driver::Device::config\\_queue\(\)](#), [L4Re::Mem\\_alloc::Continuous](#), [L4virtio::Driver::Device::driver\\_acknowledge\(\)](#), [L4virtio::Driver::Device::driver\\_connect\(\)](#), [L4Re::Env::env\(\)](#), [L4\\_EINVAL](#), [L4\\_ENODEV](#), [L4\\_PAGESHIFT](#), [l4\\_round\\_page\(\)](#), [l4\\_round\\_size\(\)](#), [L4VIRTIO\\_ID\\_BLOCK](#), [L4::lpc::make\\_cap\\_rw\(\)](#), [L4Re::Util::make\\_unique\\_cap\(\)](#), [L4virtio::Driver::Device::max\\_queue\\_size\(\)](#), [L4Re::Mem\\_alloc::Pinned](#), [L4virtio::Driver::Device::register\\_ds\(\)](#), [L4Re::Rm::F::RW](#), and [L4Re::Rm::F::Search\\_addr](#).

Here is the call graph for this function:

### 16.373.2.6 start\_request()

```

Handle L4virtio::Driver::Block_device::start_request (
    l4_uint64_t sector,
    l4_uint32_t type,
    Callback callback) [inline]
  
```

Start the setup of a new request.

#### Parameters

<i>sector</i>	First sector to write to/read from.
<i>type</i>	Request type.
<i>callback</i>	Function to call, when the request is finished. May be 0 for synchronous requests.

Definition at line 191 of file [virtio-block](#).

References [L4virtio::Virtqueue::Desc::addr](#), [L4virtio::Virtqueue::Desc::flags](#), [l4virtio\\_block\\_header\\_t::ioprio](#), [L4virtio::Virtqueue::Desc::len](#), [L4virtio::Virtqueue::Desc::Flags::raw](#), [l4virtio\\_block\\_header\\_t::sector](#), and [l4virtio\\_block\\_header\\_t::type](#)

*Send a request to the device.*

## 16.375.1 Detailed Description

Client-side implementation for a general virtio device.

Definition at line 31 of file `l4virtio`.

## 16.375.2 Member Function Documentation

### 16.375.2.1 bind\_notification\_irq()

```
int L4virtio::Driver::Device::bind_notification_irq (
    unsigned index,
    L4::Cap< L4::Triggerable > irq) const [inline]
```

Register a triggerable to receive notifications from the device.

#### Parameters

	<i>index</i>	Index of the interrupt.
out	<i>irq</i>	Triggerable to register for notifications.

Definition at line 129 of file `l4virtio`.

References `l4_error()`.

Here is the call graph for this function:

### 16.375.2.2 config\_queue()

```

int L4virtio::Driver::Device::config_queue (
    int num,
    unsigned size,
    l4_uint64_t desc_addr,
    l4_uint64_t avail_addr,
    l4_uint64_t used_addr) [inline]
  
```

Send the virtqueue configuration to the device.

#### Parameters

<i>num</i>	Number of queue to configure.
<i>size</i>	Size of rings in the queue, must be a power of 2)
<i>desc_addr</i>	Address of descriptor table (device address)
<i>avail_addr</i>	Address of available ring (device address)
<i>used_addr</i>	Address of used ring (device address)

Definition at line 212 of file [l4virtio](#).

Referenced by [L4virtio::Driver::Block\\_device::setup\\_device\(\)](#), and [L4virtio::Driver::Virtio\\_net\\_device::setup\\_device\(\)](#).

Here is the caller graph for this function:

### 16.375.2.3 driver\_acknowledge()

```
int L4virtio::Driver::Device::driver_acknowledge () [inline]
```

Finalize handshake with the device.

Must be called after all queues have been set up and before the first request is sent. It is still possible to add more shared dataspace after the handshake has been finished.

Definition at line 156 of file [l4virtio](#).

References [L4Re::chksys\(\)](#), [L4\\_EINVAL](#), [L4\\_EIO](#), [L4\\_ENODEV](#), [L4\\_EOK](#), [L4VIRTIO\\_FEATURE\\_VERSION\\_1](#), [l4virtio\\_get\\_feature\(\)](#), [L4VIRTIO\\_STATUS\\_DRIVER\\_OK](#), and [L4VIRTIO\\_STATUS\\_FEATURES\\_OK](#).

Here is the call graph for this function:

Here is the caller graph for this function:

### 16.375.2.4 driver\_connect()

```
void L4virtio::Driver::Device::driver_connect (
    L4::Cap< L4virtio::Device > srvcap,
    bool manage_notify = true) [inline]
```

Contacts the device and starts the initial handshake.

#### Parameters

---

<i>srvcap</i>	Capability for device communication.
<i>manage_notify</i>	Set up a semaphore for notifications from the device. See below.

### Exceptions

<a href="#">L4::Runtime_error</a>	if the initialisation fails
-----------------------------------	-----------------------------

This function contacts the server, sets up the notification channels and the configuration dataspace. After this is done, the caller can set up any dataspaces it needs. The initialisation then needs to be finished by calling [driver\\_acknowledge\(\)](#).

Per default this function creates and registers a semaphore for receiving notification from the device. This semaphore is used in the blocking functions [send\\_and\\_wait\(\)](#), [wait\(\)](#) and [next\\_used\(\)](#).

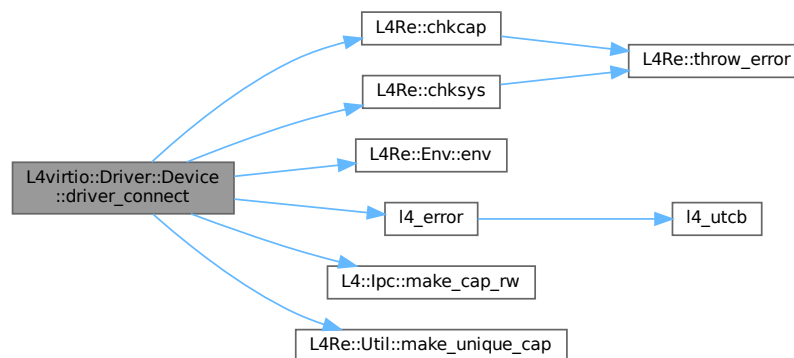

When `manage_notify` is false, then the caller may manually register and handle notification interrupts from the device. This is for example useful, when the client runs in an application with a server loop.

Definition at line 56 of file [l4virtio](#).

References [L4Re::chkcap\(\)](#), [L4Re::chksys\(\)](#), [L4Re::Env::env\(\)](#), [L4\\_EINVAL](#), [L4\\_EIO](#), [L4\\_ENODEV](#), [l4\\_error\(\)](#), [L4\\_PAGEMASK](#), [L4\\_PAGESHIFT](#), [L4\\_PAGESIZE](#), [L4\\_SUPERPAGESIZE](#), [L4VIRTIO\\_STATUS\\_ACKNOWLEDGE](#), [L4VIRTIO\\_STATUS\\_DRIVER](#), [L4::lpc::make\\_cap\\_rw\(\)](#), [L4Re::Util::make\\_unique\\_cap\(\)](#), [L4Re::Rm::F::RW](#), and [L4Re::Rm::F::Search\\_addr](#).

Here is the call graph for this function:

Here is the caller graph for this function:

#### 16.375.2.5 `feature_negotiated()`

```
bool L4virtio::Driver::Device::feature_negotiated (
    unsigned int feat) const [inline]
```

Check if a particular feature bit was negotiated with the device.

The result is only valid after [driver\\_acknowledge\(\)](#) was called (when the handshake with the device was completed).

##### Parameters

<i>feat</i>	The feature bit.
-------------	------------------

##### Return values

<i>true</i>	The feature is supported by both driver and device.
<i>false</i>	The feature is not supported by the driver and/or device.

Definition at line [145](#) of file [l4virtio](#).

References [l4virtio\\_get\\_feature\(\)](#).

Here is the call graph for this function:

### 16.375.2.6 max\_queue\_size()

```
int L4virtio::Driver::Device::max_queue_size (
    int num) const [inline]
```

Maximum queue size allowed by the device.

#### Parameters

<i>num</i>	Number of queue for which to determine the maximum size.
------------	--

Definition at line 230 of file [l4virtio](#).

Referenced by [L4virtio::Driver::Virtio\\_net\\_device::rx\\_queue\\_size\(\)](#), [L4virtio::Driver::Block\\_device::setup\\_device\(\)](#), and [L4virtio::Driver::Virtio\\_net\\_device::tx\\_queue\\_size\(\)](#).

Here is the caller graph for this function:

### 16.375.2.7 register\_ds()

```
int L4virtio::Driver::Device::register_ds (
    L4::Cap< L4Re::Dataspace > ds,
    l4_umword_t offset,
    l4_umword_t size,
    l4_uint64_t * devaddr) [inline]
```

Share a dataspace with the device.

#### Parameters

<i>ds</i>	Dataspace to share with the device.
<i>offset</i>	Offset in dataspace where the shared part starts.
<i>size</i>	Total size in bytes of the shared space.
<i>devaddr</i>	Start of shared space in the device address space.

Although this function allows to share only a part of the given dataspace for convenience, the granularity of sharing is always the dataspace level. Thus, the remainder of the dataspace is not protected from the device.

When communicating with the device, addresses must be given with respect to the device address space. This is not the same as the virtual address space of the client in order to not leak information about the address space layout.

Definition at line 196 of file [l4virtio](#).

References [L4::lpc::make\\_cap\\_rw\(\)](#).

Referenced by [L4virtio::Driver::Block\\_device::setup\\_device\(\)](#), and [L4virtio::Driver::Virtio\\_net\\_device::setup\\_device\(\)](#).

Here is the call graph for this function:

### 16.375.2.8 send()

```
void L4virtio::Driver::Device::send (
    Virtqueue & queue,
    l4_uint16_t descno) [inline]
```

Send a request to the device.

#### Parameters

<i>queue</i>	Queue that contains the request in its descriptor table
<i>descno</i>	Index of first entry in descriptor table where

Definition at line 312 of file [l4virtio](#).

References [L4virtio::Driver::Virtqueue::enqueue\\_descriptor\(\)](#).

Referenced by [send\\_and\\_wait\(\)](#), [L4virtio::Driver::Block\\_device::send\\_request\(\)](#), and [L4virtio::Driver::Virtio\\_net\\_device::tx\(\)](#).

Here is the call graph for this function:

Here is the caller graph for this function:

### 16.375.2.9 send\_and\_wait()

```
int L4virtio::Driver::Device::send_and_wait (
    Virtqueue & queue,
    l4_uint16_t descno) [inline]
```

Send a request to the device and wait for it to be processed.

#### Parameters

<i>queue</i>	Queue that contains the request in its descriptor table
<i>descno</i>	Index of first entry in descriptor table where

This function provides a simple mechanism to send requests synchronously. It must not be used with other requests at the same time as it directly waits for a notification on the device irq cap.

**Precondition**

`driver_connect()` was called with `manage_notify`.

Definition at line 247 of file `l4virtio`.

References `L4_EINVAL`, `L4_EOK`, `send()`, and `wait_for_next_used()`.

Referenced by `L4virtio::Driver::Block_device::process_request()`.

Here is the caller graph for this function:

**16.375.2.10 wait()**

```
int L4virtio::Driver::Device::wait (
    int index) const [inline]
```

Wait for a notification from the device.

**Parameters**

<i>index</i>	Notification slot to wait for.
--------------	--------------------------------

**Precondition**

`driver_connect()` was called with `manage_notify`.

Definition at line 268 of file `l4virtio`.

References `L4_EEXIST`, `l4_ipc_error()`, and `l4_utcb()`.

Referenced by `wait_for_next_used()`.

Here is the call graph for this function:

Here is the caller graph for this function:

**16.375.2.11 wait\_for\_next\_used()**

```

int L4virtio::Driver::Device::wait_for_next_used (
    Virtqueue & queue,
    l4_uint32_t * len = nullptr) const [inline]
  
```

Wait for the next item to arrive in the used queue and return it.

**Parameters**

	<i>queue</i>	A queue.
out	<i>len</i>	(optional) Size of valid data in finished block. Note that this is the value reported by the device, which may set it to a value that is larger than the original buffer size.

**Return values**

$\geq 0$	Descriptor number of item removed from used queue.
$< 0$	IPC error while waiting for notification.

The call blocks until the next item is available in the used queue.

**Precondition**

[driver\\_connect\(\)](#) was called with `manage_notify`.

### 16.376.1 Detailed Description

Simple class for accessing a virtio net device.

Definition at line 30 of file [virtio-net](#).

### 16.376.2 Member Function Documentation

#### 16.376.2.1 `bind_rx_notification_irq()`

```
int L4virtio::Driver::Virtio_net_device::bind_rx_notification_irq (  
    L4::Cap< L4::Thread > thread,  
    l4_umword_t label) [inline]
```

Bind the rx notification IRQ to the specified thread.

##### Parameters

<i>thread</i>	Thread to bind the notification IRQ to.
<i>label</i>	Label to assign to the IRQ.

Definition at line 169 of file [virtio-net](#).

References [l4\\_error\(\)](#).

Here is the call graph for this function:

#### 16.376.2.2 `finish_rx()`

```
void L4virtio::Driver::Virtio_net_device::finish_rx (  
    l4_uint16_t descno) [inline]
```

Free an RX descriptor number to make it available for the RX queue again.

##### Parameters

<i>descno</i>	Descriptor number in the virtio queue.
---------------	--

Usually [queue\\_rx\(\)](#) should be called afterwards to queue the freed descriptor(s).

Definition at line 230 of file [virtio-net](#).

### 16.376.2.3 rx\_pkt()

```
Packet & L4virtio::Driver::Virtio_net_device::rx_pkt (
    l4_uint16_t descno) [inline]
```

Return a reference to the RX packet buffer of the specified descriptor, e.g.

from [wait\\_rx\(\)](#).

#### Parameters

<i>descno</i>	Descriptor number in the virtio queue.
---------------	--

Definition at line 180 of file [virtio-net](#).

### 16.376.2.4 rx\_queue\_size()

```
int L4virtio::Driver::Virtio_net_device::rx_queue_size () const [inline]
```

Return the maximum receive queue size allowed by the device.

[wait\\_rx\(\)](#) will return a descriptor number that is smaller than this size.

Definition at line 47 of file [virtio-net](#).

References [L4virtio::Driver::Device::max\\_queue\\_size\(\)](#).

Referenced by [setup\\_device\(\)](#).

Here is the call graph for this function:

Here is the caller graph for this function:

### 16.376.2.5 `setup_device()`

```
void L4virtio::Driver::Virtio_net_device::setup_device (  
    L4::Cap< L4virtio::Device > srvcap) [inline]
```

Establish a connection to the device and set up shared memory.

#### Parameters

---

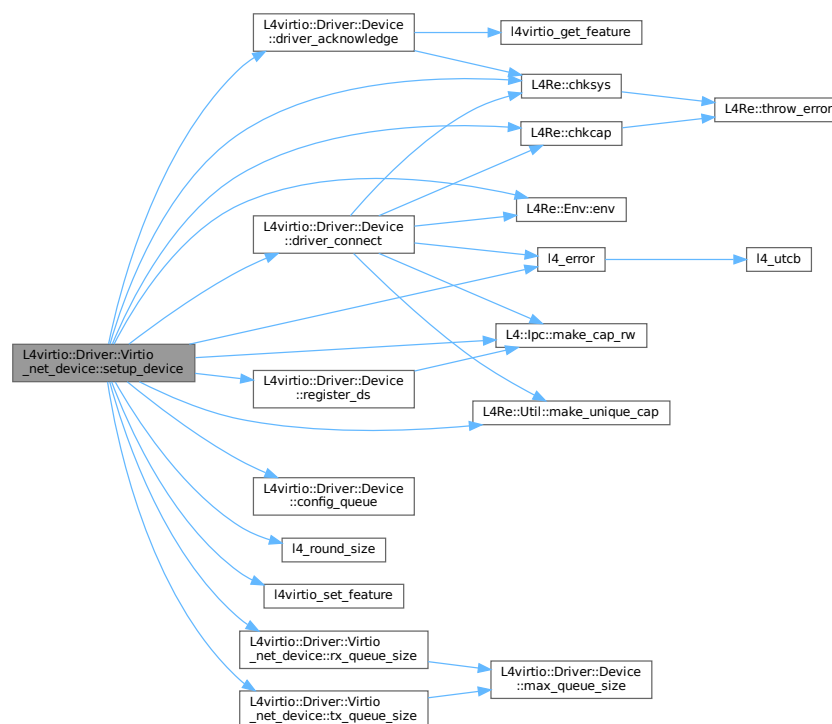

<i>srvcap</i>	IPC capability of the channel to the server.
---------------	--

This function starts a handshake with the device and sets up the virtqueues for communication and the additional data structures for the network device.

Definition at line 66 of file [virtio-net](#).

References [L4Re::chkcap\(\)](#), [L4Re::chksys\(\)](#), [L4virtio::Driver::Device::config\\_queue\(\)](#), [L4Re::Mem\\_alloc::Continuous](#), [L4virtio::Driver::Device::driver\\_acknowledge\(\)](#), [L4virtio::Driver::Device::driver\\_connect\(\)](#), [L4Re::Env::env\(\)](#), [L4\\_EINVAL](#), [L4\\_ENODEV](#), [l4\\_error\(\)](#), [L4\\_PAGESHIFT](#), [l4\\_round\\_size\(\)](#), [L4VIRTIO\\_FEATURE\\_VERSION\\_1](#), [L4VIRTIO\\_ID\\_NET](#), [l4virtio\\_set\\_feature\(\)](#), [L4::lpc::make\\_cap\\_rw\(\)](#), [L4Re::Util::make\\_unique\\_cap\(\)](#), [L4Re::Mem\\_alloc::Pinned](#), [L4virtio::Driver::Device::register\\_ds\(\)](#), [L4Re::Rm::F::RW](#), [rx\\_queue\\_size\(\)](#), [L4Re::Rm::F::Search\\_addr](#), and [tx\\_queue\\_size\(\)](#).

Here is the call graph for this function:

### 16.376.2.6 tx()

```
bool L4virtio::Driver::Virtio_net_device::tx (
    std::function< l4_uint32_t(Packet &)> prepare) [inline]
```

Attempt to allocate a descriptor in the TX queue and transmit the packet, after calling the prepare callback.

#### Parameters

<i>prepare</i>	Function that fills the packet with data, should return the length of the data copied to the packet.
----------------	--

### Return values

<i>true</i>	The packet was queued.
<i>false</i>	TX queue is full.

The prepare callback should fill the packet with data and return the length of the packet data (without the size of the virtio-net packet header).

Definition at line 260 of file [virtio-net](#).

References [L4virtio::Driver::Device::send\(\)](#).

Here is the call graph for this function:

### 16.376.2.7 tx\_queue\_size()

```
int L4virtio::Driver::Virtio_net_device::tx_queue_size () const [inline]
```

Return the maximum transmit queue size allowed by the device.

[tx\(\)](#) will fail if the amount of queued packets exceeds this size.

Definition at line 54 of file [virtio-net](#).

References [L4virtio::Driver::Device::max\\_queue\\_size\(\)](#).

Referenced by [setup\\_device\(\)](#).

Here is the call graph for this function:

Here is the caller graph for this function:

### 16.376.2.8 wait\_rx()

```

l4_uint16_t L4virtio::Driver::Virtio_net_device::wait_rx (
    l4_uint32_t * len = nullptr) [inline]
  
```

Block until a network packet has been received from the device and return the descriptor number.

#### Precondition

The calling thread must be bound to the rx notification IRQ via `bind_rx_notification_irq()`.

#### Parameters

out	len	(optional) Length of valid data in RX packet.
-----	-----	---

#### Returns

Descriptor number of received packet.

The packet data can be obtained with `rx_pkt()`. `finish_rx()` should be called after the packet buffer can be returned to the RX queue.

Definition at line 202 of file `virtio-net`.

References `L4Re::chksys()`.

Here is the call graph for this function:

The documentation for this class was generated from the following file:

- `l4/l4virtio/client/virtio-net`

## 16.377 L4virtio::Driver::Virtio\_net\_device::Packet Struct Reference

Structure for a network packet (header including data) with maximum size, assuming that no extra features have been negotiated.

```
#include <virtio-net>
```

Collaboration diagram for L4virtio::Driver::Virtio\_net\_device::Packet:

### 16.377.1 Detailed Description

Structure for a network packet (header including data) with maximum size, assuming that no extra features have been negotiated.

Definition at line 37 of file [virtio-net](#).

*mask used for indexing into the descriptor table and the rings.*

### 16.378.1 Detailed Description

Driver-side implementation of a [Virtqueue](#).

Adds function for managing the descriptor list, enqueueing new and dequeueing finished requests.

#### Note

The [Virtqueue](#) implementation is not thread-safe.

Definition at line 470 of file [virtqueue](#).

## 16.378.2 Member Function Documentation

### 16.378.2.1 alloc\_descriptor()

```
l4_uint16_t L4virtio::Driver::Virtqueue::alloc_descriptor () [inline]
```

Allocate and return an unused descriptor from the descriptor table.

The descriptor will be removed from the free list, the content should be considered undefined. After use, it needs to be freed using [free\\_descriptor\(\)](#).

#### Returns

The index of the reserved descriptor or Virtqueue::Eq if no free descriptor is available.

Note: the implementation uses  $(2^{16} - 1)$  as the end of queue marker. That means that the final entry in the queue can not be allocated iff the queue size is  $2^{16}$ .

Definition at line 558 of file [virtqueue](#).

References [L4virtio::Virtqueue::\\_desc](#).

### 16.378.2.2 desc()

```
Desc & L4virtio::Driver::Virtqueue::desc (
    l4_uint16_t descno) [inline]
```

Return a reference to a descriptor in the descriptor table.

#### Parameters

<i>descno</i>	Index of the descriptor, expected to be in correct range.
---------------	---

Definition at line 590 of file [virtqueue](#).

References [L4virtio::Virtqueue::\\_desc](#), and [L4virtio::Virtqueue::\\_idx\\_mask](#).

Referenced by [init\\_queue\(\)](#).

Here is the caller graph for this function:

### 16.378.2.3 enqueue\_descriptor()

```
void L4virtio::Driver::Virtqueue::enqueue_descriptor (
    l4_uint16_t descno) [inline]
```

Enqueue a descriptor in the available ring.

#### Parameters

<i>descno</i>	Index of the head descriptor to enqueue.
---------------	--

Definition at line 574 of file [virtqueue](#).

References [L4virtio::Virtqueue::\\_avail](#), and [L4virtio::Virtqueue::\\_idx\\_mask](#).

Referenced by [L4virtio::Driver::Device::send\(\)](#).

Here is the caller graph for this function:

#### 16.378.2.4 find\_next\_used()

```

14_uint16_t L4virtio::Driver::Virtqueue::find_next_used (
    14_uint32_t * len = nullptr) [inline]
  
```

Return the next finished block.

##### Parameters

out	<i>len</i>	(optional) Size of valid data in finished block. Note that this is the value reported by the device, which may set it to a value that is larger than the original buffer size.
-----	------------	--

##### Returns

Index of the head or `Virtqueue::Eoq` if no used element is currently available.

Definition at line 609 of file [virtqueue](#).

References [L4virtio::Virtqueue::\\_current\\_avail](#), [L4virtio::Virtqueue::\\_idx\\_mask](#), and [L4virtio::Virtqueue::\\_used](#).

Referenced by [L4virtio::Driver::Device::wait\\_for\\_next\\_used\(\)](#).

Here is the caller graph for this function:

### 16.378.2.5 free\_descriptor()

```
void L4virtio::Driver::Virtqueue::free_descriptor (
    14_uint16_t head,
    14_uint16_t tail) [inline]
```

Free a chained list of descriptors in the descriptor queue.

#### Parameters

---

<i>head</i>	Index of the first element in the descriptor chain.
<i>tail</i>	Index of the last element in the descriptor chain.

Simply takes the descriptor chain and prepends it to the beginning of the free list. Assumes that the list has been correctly chained.

Definition at line 631 of file [virtqueue](#).

References [L4virtio::Virtqueue::\\_desc](#), and [L4virtio::Virtqueue::\\_idx\\_mask](#).

### 16.378.2.6 `init_queue()` [1/2]

```
void L4virtio::Driver::Virtqueue::init_queue (
    unsigned num,
    void * base) [inline]
```

Initialize this virtqueue.

#### Parameters

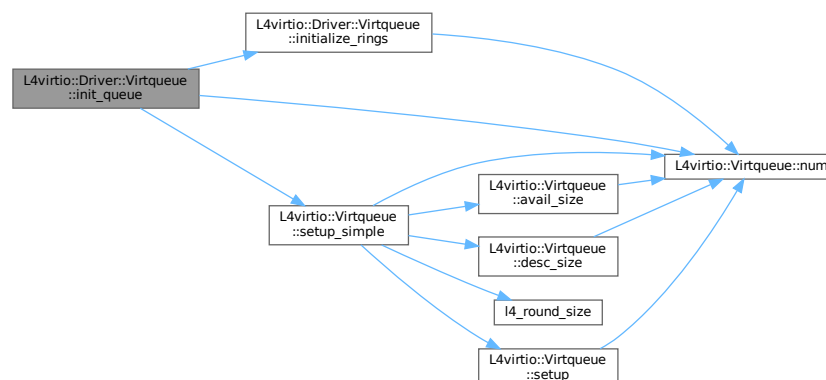

<i>num</i>	The number of entries in the descriptor table, the available ring, and the used ring (must be a power of 2).
<i>base</i>	The base address for the queue data structure.

This function sets up the memory and initializes the freelist.

Definition at line 537 of file [virtqueue](#).

References [initialize\\_rings\(\)](#), [L4virtio::Virtqueue::num\(\)](#), and [L4virtio::Virtqueue::setup\\_simple\(\)](#).

Here is the call graph for this function:

### 16.378.2.7 init\_queue() [2/2]

```
void L4virtio::Driver::Virtqueue::init_queue (
    unsigned num,
    void * desc,
    void * avail,
    void * used) [inline]
```

Initialize this virtqueue.

#### Parameters

---

<i>num</i>	The number of entries in the descriptor table, the available ring, and the used ring (must be a power of 2).
<i>desc</i>	The address of the descriptor table. (Must be <code>Desc_align</code> aligned and at least <code>desc_size(num)</code> bytes in size.)
<i>avail</i>	The address of the available ring. (Must be <code>Avail_align</code> aligned and at least <code>avail_size(num)</code> bytes in size.)
<i>used</i>	The address of the used ring. (Must be <code>Used_align</code> aligned and at least <code>used_size(num)</code> bytes in size.)

This function sets up the memory and initializes the freelist.

Definition at line 522 of file [virtqueue](#).

References [desc\(\)](#), [initialize\\_rings\(\)](#), [L4virtio::Virtqueue::num\(\)](#), and [L4virtio::Virtqueue::setup\(\)](#).

Here is the call graph for this function:

### 16.378.2.8 initialize\_rings()

```
void L4virtio::Driver::Virtqueue::initialize_rings (
    unsigned num) [inline]
```

Initialize the descriptor table and the index structures of this queue.

#### Parameters

<i>num</i>	The number of entries in the descriptor table, the available ring, and the used ring (must be a power of 2).
------------	--

**Precondition**

The queue must be set up correctly with [setup\(\)](#) or [setup\\_simple\(\)](#).

Definition at line [494](#) of file [virtqueue](#).

References [L4virtio::Virtqueue::\\_avail](#), [L4virtio::Virtqueue::\\_desc](#), [L4virtio::Virtqueue::\\_used](#), and [L4virtio::Virtqueue::num\(\)](#).

Referenced by [init\\_queue\(\)](#), and [init\\_queue\(\)](#).

Here is the call graph for this function:

Here is the caller graph for this function:

The documentation for this class was generated from the following file:

## 16.379 L4virtio::Ptr< T > Class Template Reference

Pointer used in virtio descriptors.

```
#include <virtqueue>
```

Inheritance diagram for L4virtio::Ptr< T >:

Collaboration diagram for L4virtio::Ptr< T >:

## Public Types

- enum `Invalid_type` { `Invalid` }  
*Type for making an invalid (NULL) `Ptr`.*

## Public Member Functions

- `Ptr` (`Invalid_type`)

Make and invalid [Ptr](#).

- [Ptr](#) ([l4\\_uint64\\_t](#) vm\_addr)

Make a [Ptr](#) from a raw 64bit address.

- [l4\\_uint64\\_t](#) get () const
- bool [is\\_valid](#) () const

## 16.379.1 Detailed Description

```
template<typename T>
class L4virtio::Ptr< T >
```

Pointer used in virtio descriptors.

As the descriptor contain guest addresses these pointers cannot be dereferenced directly.

Definition at line 47 of file [virtqueue](#).

## 16.379.2 Member Enumeration Documentation

### 16.379.2.1 Invalid\_type

```
template<typename T>
enum L4virtio::Ptr::Invalid_type
```

Type for making an invalid (NULL) [Ptr](#).

#### Enumerator

Invalid	Use to set a <a href="#">Ptr</a> to invalid (NULL).
---------	---

Definition at line 51 of file [virtqueue](#).

## 16.379.3 Member Function Documentation

### 16.379.3.1 get()

```
template<typename T>
l4_uint64_t L4virtio::Ptr< T >::get () const [inline]
```

**Returns**

The raw 64bit address of the stored pointer.

Definition at line 62 of file [virtqueue](#).

Referenced by [L4virtio::Svr::Driver\\_mem\\_list\\_t< No\\_custom\\_data >::load\\_desc\(\)](#), [L4virtio::Svr::Driver\\_mem\\_list\\_t< No\\_custom\\_data >::load\\_desc\(\)](#), [L4virtio::Svr::Driver\\_mem\\_list\\_t< No\\_custom\\_data >::load\\_desc\(\)](#), and [L4virtio::Svr::Driver\\_mem\\_region\\_t< No\\_custom\\_data >::local](#).

Here is the caller graph for this function:

**16.379.3.2 is\_valid()**

```
template<typename T>
bool L4virtio::Ptr< T >::is_valid () const [inline]
```

**Returns**

true if the stored pointer is valid (not NULL).

Definition at line 65 of file [virtqueue](#).

The documentation for this class was generated from the following file:

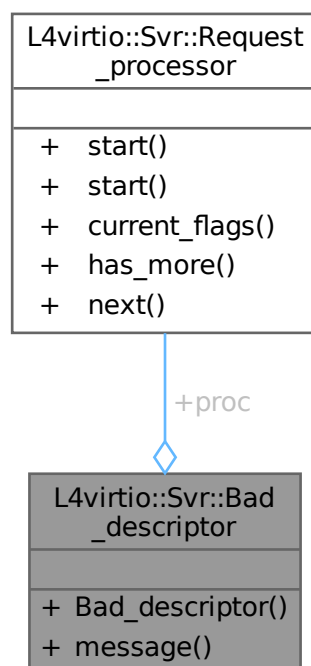

- `I4/I4virtio/virtqueue`

## 16.380 L4virtio::Svr::Bad\_descriptor Struct Reference

Exception used by Queue to indicate descriptor errors.

```
#include <virtio>
```

Collaboration diagram for L4virtio::Svr::Bad\_descriptor:

### Public Types

- enum [Error](#) {  
[Bad\\_address](#) , [Bad\\_rights](#) , [Bad\\_flags](#) , [Bad\\_next](#) ,  
[Bad\\_size](#) }

*The error code.*

### Public Member Functions

- [Bad\\_descriptor](#) ([Request\\_processor](#) const \*[proc](#), [Error](#) e)  
*Make a bad descriptor exception.*
- char const \* [message](#) () const  
*Get a human readable description of the error code.*

### Data Fields

- [Request\\_processor](#) const \* **proc**  
*The processor that triggered the exception.*

### 16.380.1 Detailed Description

Exception used by Queue to indicate descriptor errors.

Definition at line 397 of file [virtio](#).

### 16.380.2 Member Enumeration Documentation

#### 16.380.2.1 Error

```
enum L4virtio::Svr::Bad_descriptor::Error
```

The error code.

##### Enumerator

Bad_address	Address cannot be translated.
Bad_rights	Missing access rights on memory.
Bad_flags	Invalid combination of descriptor flags.
Bad_next	Invalid next index.
Bad_size	Invalid size of memory block.

Definition at line 400 of file [virtio](#).

### 16.380.3 Constructor & Destructor Documentation

#### 16.380.3.1 Bad\_descriptor()

```
L4virtio::Svr::Bad_descriptor::Bad_descriptor (
    Request_processor const * proc,
    Error e) [inline]
```

Make a bad descriptor exception.

##### Parameters

<i>proc</i>	The request processor causing the exception
<i>e</i>	The error code.

Definition at line 421 of file [virtio](#).

References [proc](#).

## 16.380.4 Member Function Documentation

### 16.380.4.1 message()

```
char const * L4virtio::Svr::Bad_descriptor::message () const [inline]
```

Get a human readable description of the error code.

#### Returns

Message describing the error.

Definition at line 430 of file [virtio](#).

References [Bad\\_address](#), [Bad\\_flags](#), [Bad\\_next](#), [Bad\\_rights](#), and [Bad\\_size](#).

Referenced by [Virtio\\_switch::handle\\_l4virtio\\_port\\_tx\(\)](#).

## 16.381.1 Detailed Description

```
template<typename Ds_data>
class L4virtio::Svr::Block_dev_base< Ds_data >
```

Base class for virtio block devices.

Use this class as a base to implement your own specific block device.

Definition at line 259 of file `virtio-block`.

## 16.381.2 Constructor & Destructor Documentation

### 16.381.2.1 `Block_dev_base()`

```
template<typename Ds_data>
L4virtio::Svr::Block_dev_base< Ds_data >::Block_dev_base (
    l4_uint32_t vendor,
    unsigned queue_size,
    l4_uint64_t capacity,
    bool read_only) [inline]
```

Create a new virtio block device.

#### Parameters

<i>vendor</i>	Vendor ID
<i>queue_size</i>	Number of entries to provide in avail and used queue.
<i>capacity</i>	Size of the device in 512-byte sectors.
<i>read_only</i>	True, if the device should not be writable.

Definition at line 444 of file [virtio-block](#).

References [L4virtio::Svr::Device\\_t< Ds\\_data >::Device\\_t\(\)](#), [L4VIRTIO\\_FEATURE\\_VERSION\\_1](#), [L4VIRTIO\\_ID\\_BLOCK](#), and [L4virtio::Svr::Device\\_t< Ds\\_data >::reset\\_queue\\_config\(\)](#).

Here is the call graph for this function:

## 16.381.3 Member Function Documentation

### 16.381.3.1 finalize\_request()

```

template<typename Ds_data>
void L4virtio::Svr::Block_dev_base< Ds_data >::finalize_request (
    cxx::unique_ptr< Request > req,
    unsigned sz,
    l4_uint8_t status = L4VIRTIO_BLOCK_S_OK) [inline]
  
```

Releases resources related to a request and notifies the client.

#### Parameters

<i>req</i>	Pointer to request that has finished.
<i>sz</i>	Number of bytes consumed.
<i>status</i>	Status of request (see <a href="#">L4virtio_block_status</a> ).

This function must be called when an asynchronous request finishes, either successfully or with an error. The status byte in the request must have been set prior to calling it.

Definition at line 483 of file [virtio-block](#).

References [L4virtio::Svr::Device\\_t< Ds\\_data >::device\\_error\(\)](#), [L4VIRTIO\\_BLOCK\\_S\\_OK](#), [L4VIRTIO\\_IRQ\\_STATUS\\_VRING](#), and [L4virtio::Virtqueue::no\\_notify\\_guest\(\)](#).

Here is the call graph for this function:

### 16.381.3.2 get\_writeback()

```
template<typename Ds_data>
l4_uint8_t L4virtio::Svr::Block_dev_base< Ds_data >::get_writeback () [inline], [protected]
```

Get the writeback field from the configuration space.

#### Returns

Value of the writeback field.

Definition at line 388 of file [virtio-block](#).

### 16.381.3.3 set\_blk\_size()

```
template<typename Ds_data>
void L4virtio::Svr::Block_dev_base< Ds_data >::set_blk_size (
    l4_uint32_t sz) [inline], [protected]
```

Sets block disk size to be reported to the client.

Setting this does not change the logical sector size used for addressing the device.

Definition at line 332 of file [virtio-block](#).

### 16.381.3.4 set\_config\_wce()

```
template<typename Ds_data>
void L4virtio::Svr::Block_dev_base< Ds_data >::set_config_wce (
    l4_uint8_t writeback) [inline], [protected]
```

Sets cache mode and enables the writeback toggle.

#### Parameters

---

<i>writeback</i>	Mode of the cache (0 for writethrough, 1 for writeback).
------------------	--

Definition at line 375 of file [virtio-block](#).

### 16.381.3.5 set\_discard()

```
template<typename Ds_data>
void L4virtio::Svr::Block_dev_base< Ds_data >::set_discard (
    14_uint32_t max_discard_sectors,
    14_uint32_t max_discard_seg,
    14_uint32_t discard_sector_alignment) [inline], [protected]
```

Sets constraints for and enables the discard command.

#### Parameters

<i>max_discard_sectors</i>	Maximum discard sectors size.
<i>max_discard_seg</i>	Maximum discard segment number.
<i>discard_sector_alignment</i>	Can be used by the driver when splitting a request based on alignment.

Definition at line 402 of file [virtio-block](#).

### 16.381.3.6 set\_size\_max()

```
template<typename Ds_data>
void L4virtio::Svr::Block_dev_base< Ds_data >::set_size_max (
    14_uint32_t sz) [inline], [protected]
```

Sets the maximum size of any single segment reported to client.

The limit is also applied to any incoming requests. Requests with larger segments result in an IO error being reported to the client. That means that `process_request()` can safely make the assumption that all segments in the received request are smaller.

Definition at line 290 of file [virtio-block](#).

### 16.381.3.7 set\_topology()

```
template<typename Ds_data>
void L4virtio::Svr::Block_dev_base< Ds_data >::set_topology (
    14_uint8_t physical_block_exp,
    14_uint8_t alignment_offset,
    14_uint32_t min_io_size,
    14_uint32_t opt_io_size) [inline], [protected]
```

Sets the I/O alignment information reported back to the client.

#### Parameters

<i>physical_block_exp</i>	Number of logical blocks per physical block(log2)
<i>alignment_offset</i>	Offset of the first aligned logical block
<i>min_io_size</i>	Suggested minimum I/O size in blocks
<i>opt_io_size</i>	Optimal I/O size in blocks

Definition at line 348 of file [virtio-block](#).

### 16.381.3.8 set\_write\_zeroes()

```
template<typename Ds_data>
void L4virtio::Svr::Block_dev_base< Ds_data >::set_write_zeroes (
    14_uint32_t max_write_zeroes_sectors,
    14_uint32_t max_write_zeroes_seg,
    14_uint8_t write_zeroes_may_unmap) [inline], [protected]
```

Sets constraints for and enables the write zeroes command.

#### Parameters

<i>max_write_zeroes_sectors</i>	Maximum write zeroes sectors size.
<i>max_write_zeroes_seg</i>	maximum write zeroes segment number.
<i>write_zeroes_may_unmap</i>	Set if a write zeroes request can result in deallocating one or more sectors.

Definition at line 422 of file [virtio-block](#).

*Return next block in scatter-gather list.*
- [l4virtio\\_block\\_header\\_t](#) const & **header** () const  
*Return the block request header.*

## 16.382.1 Detailed Description

```
template<typename Ds_data>
class L4virtio::Svr::Block_request< Ds_data >
```

A request to read or write data.

Definition at line 28 of file [virtio-block](#).

## 16.382.2 Member Function Documentation

### 16.382.2.1 data\_size()

```
template<typename Ds_data>
unsigned L4virtio::Svr::Block_request< Ds_data >::data_size () const [inline]
```

Compute the total size of the data in the request.

#### Return values

Size	in bytes or 0 if there was an error.
------	--------------------------------------

#### Exceptions

<a href="#">L4::Runtime_error(-L4_EIO)</a>	Request has a bad format.
--	---------------------------

Note that this operation is relatively expensive as it has to iterate over the complete list of blocks.

Definition at line 63 of file [virtio-block](#).

References [L4virtio::Svr::Request\\_processor::has\\_more\(\)](#), [L4\\_EIO](#), [L4virtio::Svr::Request\\_processor::next\(\)](#), and [L4virtio::Svr::Request\\_processor::start\(\)](#).

Here is the call graph for this function:

### 16.382.2.2 next\_block()

```
template<typename Ds_data>
Data_block L4virtio::Svr::Block_request< Ds_data >::next_block () [inline]
```

Return next block in scatter-gather list.

#### Returns

Information about the next data block.

#### Exceptions

<a href="#"><i>L4::Runtime_error</i></a>	No more data block is available.
<a href="#"><i>Bad_descriptor</i></a>	Virtio request is corrupted.

Definition at line 113 of file [virtio-block](#).

## 16.384 L4virtio::Svr::Console::Control\_request Struct Reference

Specialised `Virtqueue::Request` providing access to control message payload.

```
#include <virtio-console>
```

Collaboration diagram for L4virtio::Svr::Console::Control\_request:

## Data Fields

- **Control\_message \* msg**  
Virtual address of the data block (in device space).
- **l4\_uint32\_t len**  
Length of datablock in bytes.
- **Driver\_mem\_region \* mem**  
Pointer to driver memory region.

### 16.384.1 Detailed Description

Specialised `Virtqueue::Request` providing access to control message payload.

Definition at line 65 of file [virtio-console](#).

The documentation for this struct was generated from the following file:

- `l4/l4virtio/server/virtio-console`

## 16.385 L4virtio::Svr::Console::Device Class Reference

Base class implementing a virtio console device with L4Re-based notification handling.

```
#include <virtio-console-device>
```

Inheritance diagram for L4virtio::Svr::Console::Device:

- Generated for L4Re by Doxygen

- Create a new console [Device](#).
- void **register\_single\_driver\_irq** () override  
callback for registering a single guest IRQ for all queues (old-style)
- [L4::Cap](#)< [L4::Irq](#) > **device\_notify\_irq** () const override  
callback to gather the device notification IRQ (old-style)
- void **notify\_queue** ([Virtqueue](#) \*queue) override  
Notify queue of available data.
- virtual void **rx\_data\_available** (unsigned [port](#))=0  
Callback to notify that new data is available to be read from port.
- virtual void **tx\_space\_available** (unsigned [port](#))=0  
Callback to notify that data can be written to port.
- virtual bool **queues\_stopped** ()  
Return true, if the queues should not be processed further.
- void **trigger\_driver\_config\_irq** () override  
callback for triggering configuration change notification IRQ
- unsigned **port\_read** (char \*buf, unsigned len, unsigned [port](#)=0)  
Read data from port.
- unsigned **port\_write** (char const \*buf, unsigned len, unsigned [port](#)=0)  
Write data to port.
- void **process\_device\_ready** ([l4\\_uint16\\_t](#) value) override  
Callback called on `DEVICE_READY` event.
- void **process\_port\_ready** ([l4\\_uint32\\_t](#) id, [l4\\_uint16\\_t](#) value) override  
Callback called on `PORT_READY` event.
- virtual void **process\_port\_open** ([l4\\_uint32\\_t](#) id, [l4\\_uint16\\_t](#) value)  
Callback called on `PORT_OPEN` event.

*Memory region list.*

## 16.385.1 Detailed Description

Base class implementing a virtio console device with L4Re-based notification handling.

This console device is derived from [Virtio\\_con](#) and already includes functionality to handle interrupts and notify drivers. If an interrupt is received, all the necessary interaction with the virtqueues is performed and only the actual data processing has to be done by the derived class. By default all available ports are added and an "open"-request of a port by the driver is automatically acknowledged. The derived class can optionally change this behaviour by overriding [process\\_device\\_ready\(\)](#), [process\\_port\\_ready\(\)](#) and [process\\_port\\_open\(\)](#).

This class provides a stream-based interface to access the port data with edge-triggered notification callbacks. If a port receives data from the driver the derived class is notified with the [rx\\_data\\_available\(\)](#) callback. The actual data can be retrieved by [port\\_read\(\)](#). If there was not enough data to be read, the call will return the available partial data. Only then will the [rx\\_data\\_available\(\)](#) callback be triggered again.

Data on a port may be transmitted by [port\\_write\(\)](#). If there were not enough buffers available, only a part of the data will be transmitted. Once there are new buffers available, the [tx\\_space\\_available\(\)](#) callback will be invoked. This callback will be called again only after a previous [port\\_write\(\)](#) was not able to send all requested data.

Use this class as a base to provide your own high-level console device. You must derive from this class as well as [L4::Epiface\\_t<..., L4virtio::Device>](#). For a working device the [irq\\_iface\(\)](#) must be registered too. A typical implementation might look like the following:

```
class My_console
: public L4virtio::Svr::Console::Device,
  public L4::Epiface_t<My_console, L4virtio::Device>
{
public:
    My_console(L4Re::Util::Object_registry *r)
        : L4virtio::Svr::Console::Device(0x100)
    {
        init_mem_info(4);
        L4Re::chkcap(r->register_irq_obj(irq_iface()), "virtio notification IRQ");
    }

    void rx_data_available(unsigned port) override
    {
        // call port_read() to fetch available data
    }

    void tx_space_available(unsigned port) override
    {
        // can call port_write() to send (pending) data
    }
};

My_console console(registry);
registry->register_obj(&console, ...);
```

The maximum number of memory regions ([init\\_mem\\_info\(\)](#)) should correlate with the number of supported ports.

Definition at line 118 of file [virtio-console-device](#).

## 16.385.2 Constructor & Destructor Documentation

### 16.385.2.1 Device() [1/3]

```
L4virtio::Svr::Console::Device::Device (
    unsigned vq_max) [inline], [explicit]
```

Create a new console device.

#### Parameters

---

<i>vq_max</i>	Maximum number of buffers in data queues.
---------------	---

Create a console device with no multiport support, i.e. control queues are disabled.

Definition at line 145 of file [virtio-console-device](#).

References [L4virtio::Svr::Console::Virtio\\_con::Virtio\\_con\(\)](#).

Here is the call graph for this function:

### 16.385.2.2 Device() [2/3]

```
L4virtio::Svr::Console::Device::Device (
    unsigned vq_max,
    unsigned ports) [inline], [explicit]
```

Create a new console device.

#### Parameters

<i>vq_max</i>	Maximum number of buffers in data queues.
<i>ports</i>	Number of ports (maximum 32).

Create a console device with multiport support, i.e. control queues are enabled.

Definition at line 163 of file [virtio-console-device](#).

References [L4virtio::Svr::Console::Virtio\\_con::Virtio\\_con\(\)](#).

Here is the call graph for this function:

### 16.385.2.3 Device() [3/3]

```
L4virtio::Svr::Console::Device::Device (
    cxx::static_vector< unsigned > const & vq_max_nums) [inline], [explicit]
```

Create a new console [Device](#).

#### Parameters

<code>vq_max_nums</code>	Maximum number of buffers in data queues, given as a <code>cx::static_vector</code> with one entry per port.
--------------------------	--

Create a console device with multiport support, i.e. control queues are enabled.

Definition at line 182 of file `virtio-console-device`.

References `L4virtio::Svr::Console::Virtio_con::Virtio_con()`.

Here is the call graph for this function:

## 16.385.3 Member Function Documentation

### 16.385.3.1 notify\_queue()

```
void L4virtio::Svr::Console::Device::notify_queue (
    Virtqueue * queue) [inline], [override], [virtual]
```

Notify queue of available data.

#### Parameters

<code>queue</code>	<code>Virtqueue</code> to notify.
--------------------	-----------------------------------

This callback is called whenever data is sent to `queue`. It is the responsibility of the derived class to perform all necessary notification actions, e.g. triggering guest interrupts.

Implements `L4virtio::Svr::Console::Virtio_con`.

Definition at line 202 of file `virtio-console-device`.

References `L4VIRTIO_IRQ_STATUS_VRING`, and `L4virtio::Virtqueue::no_notify_guest()`.

Here is the call graph for this function:

### 16.385.3.2 port()

```
Port * L4virtio::Svr::Console::Device::port (
    unsigned port) [inline], [override], [protected], [virtual]
```

Return the specified port.

#### Parameters

<i>port</i>	Port number.
-------------	--------------

#### Precondition

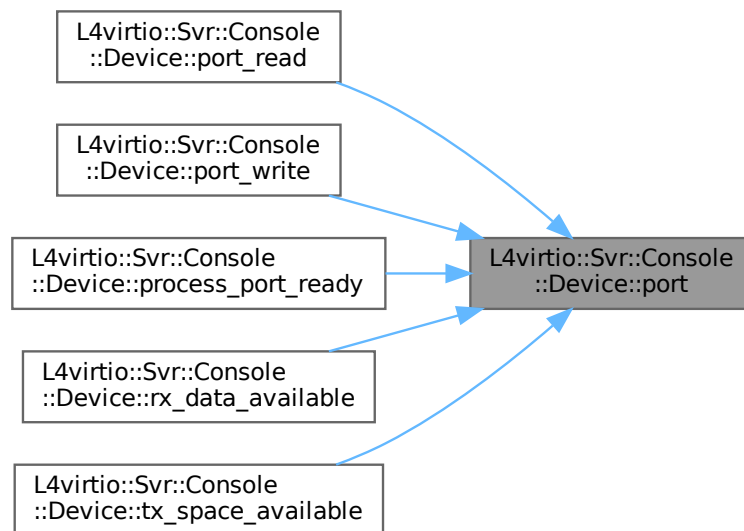

Port number must be lower than the configured maximum number of ports.

Implements [L4virtio::Svr::Console::Virtio\\_con](#).

Definition at line 450 of file [virtio-console-device](#).

Referenced by [port\\_read\(\)](#), [port\\_write\(\)](#), [process\\_port\\_ready\(\)](#), [rx\\_data\\_available\(\)](#), and [tx\\_space\\_available\(\)](#).

Here is the caller graph for this function:

### 16.385.3.3 port\_read()

```
unsigned L4virtio::Svr::Console::Device::port_read (  
    char * buf,  
    unsigned len,  
    unsigned port = 0) [inline]
```

Read data from port.

Will read up to *len* bytes from *port* into *buf*. Returns the number of bytes read, which may be less if not enough data was available. If all data was read, the [rx\\_data\\_available\(\)](#) callback will be invoked the next time the driver queues new data for the port. The callback won't be called again until all data was consumed again.

#### Parameters

---

<i>buf</i>	The destination buffer
<i>len</i>	Size of the buffer
<i>port</i>	<a href="#">Port</a> index to read data from

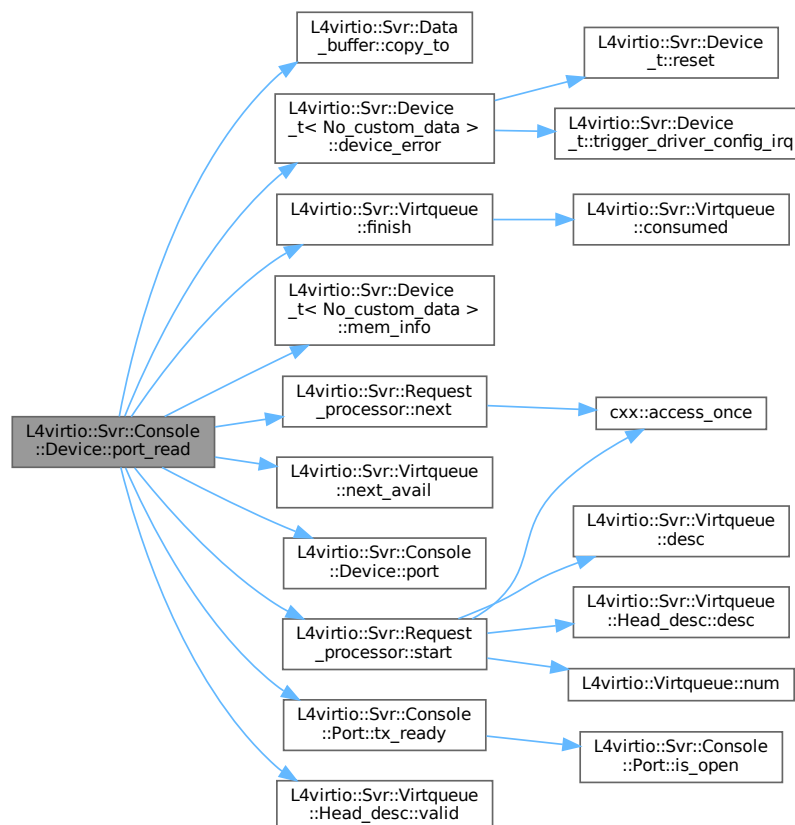

**Returns**

Number of bytes read

Definition at line 272 of file [virtio-console-device](#).

Here is the call graph for this function:

#### 16.385.3.4 port\_write()

```
unsigned L4virtio::Svr::Console::Device::port_write (
    char const * buf,
    unsigned len,
    unsigned port = 0) [inline]
```

Write data to port.

Will write up to *len* bytes to *port* from *buf*. Returns the number of bytes written, which may be less if not enough virtio buffers were available. If not all data could be written, the [tx\\_space\\_available\(\)](#) callback will be invoked the next time the driver queues new receive buffers for the port. The callback won't be called again until all receive buffers were filled again.

##### Parameters

<i>buf</i>	The source buffer
<i>len</i>	Size of the buffer
<i>port</i>	<a href="#">Port</a> index to write data to

##### Returns

Number of bytes written

Definition at line [341](#) of file [virtio-console-device](#).

References [L4virtio::Svr::Data\\_buffer::copy\\_to\(\)](#), [L4virtio::Svr::Device\\_t< No\\_custom\\_data >::device\\_error\(\)](#), [L4virtio::Svr::Virtqueue::finish\(\)](#), [L4virtio::Svr::Data\\_buffer::left](#), [L4virtio::Svr::Device\\_t< No\\_custom\\_data >::mem\\_info\(\)](#), [L4virtio::Svr::Request\\_processor::next\(\)](#), [L4virtio::Svr::Virtqueue::next\\_avail\(\)](#), [port\(\)](#), [L4virtio::Svr::Data\\_buffer::pos](#), [L4virtio::Svr::Console::Port::rx](#), [L4virtio::Svr::Console::Port::rx\\_ready\(\)](#), and [L4virtio::Svr::Request\\_processor::start\(\)](#).

Here is the call graph for this function:

### 16.385.3.5 process\_device\_ready()

```
void L4virtio::Svr::Console::Device::process_device_ready (
    uint16_t value) [inline], [override], [virtual]
```

Callback called on DEVICE\_READY event.

#### Parameters

<i>value</i>	The value field of the control message, indicating if the initialization was successful.
--------------	--

By default, this function adds all ports if the driver indicates successful initialization. Override this function to perform custom actions for a DEVICE\_READY event. It is then your responsibility to inform the driver about usable ports, see [port\\_add\(\)](#).

Implements [L4virtio::Svr::Console::Virtio\\_con](#).

Definition at line 399 of file [virtio-console-device](#).

References [L4virtio::Svr::Console::Virtio\\_con::port\\_add\(\)](#).

Here is the call graph for this function:

### 16.385.3.6 process\_port\_open()

```
virtual void L4virtio::Svr::Console::Device::process_port_open (
    14_uint32_t id,
    14_uint16_t value) [inline], [virtual]
```

Callback called on PORT\_OPEN event.

#### Parameters

<i>id</i>	The id field of the control message, i.e. the port number.
<i>value</i>	The value field of the control message, indicating if the port was opened or closed.

The default implementation does nothing. Override it to implement some custom logic to respond to open/close events of the driver.

Implements [L4virtio::Svr::Console::Virtio\\_con](#).

Definition at line 443 of file [virtio-console-device](#).

### 16.385.3.7 process\_port\_ready()

```
void L4virtio::Svr::Console::Device::process_port_ready (
    14_uint32_t id,
    14_uint16_t value) [inline], [override], [virtual]
```

Callback called on PORT\_READY event.

#### Parameters

<i>id</i>	The id field of the control message, i.e. the port number.
<i>value</i>	The value field of the control message, indicating if the initialization was successful.

By default, this function opens the port if the driver is ready. Otherwise, the port is removed if the driver failed to set it up correctly. Override this function to perform custom actions for a PORT\_READY event, *after* the generic management of the base class. It is then your responsibility to inform the driver about connected or unusable ports. See [port\\_open\(\)](#) and [port\\_remove\(\)](#).

Reimplemented from [L4virtio::Svr::Console::Virtio\\_con](#).

Definition at line 422 of file [virtio-console-device](#).

References [port\(\)](#), [L4virtio::Svr::Console::Port::Port\\_failed](#), [L4virtio::Svr::Console::Virtio\\_con::port\\_open\(\)](#), [L4virtio::Svr::Console::Port::Port\\_ready](#), [L4virtio::Svr::Console::Virtio\\_con::port\\_remove\(\)](#), [L4virtio::Svr::Console::Virtio\\_con::process\\_port\\_ready](#) and [L4virtio::Svr::Console::Port::status](#).

### 16.388.3 Field Documentation

#### 16.388.3.1 state\_transitions

```
Transition L4virtio::Svr::Console::Port::state_transitions[Port_num_states][Port_num_states]
[static], [constexpr]
```

State transition table from last report state to current state.

Not all transitions can be made directly. For example, if the last reported state was `Port_disabled` and the current state is `Port_open`, the device has to send two messages: `Control_message::Device_add` and `Control_message::Port_open`. This is expressed by going through an intermediate state (`Port_ready`) on the reporting side.

For the purpose of the driver there are only three coarse states:

1. The port does not exist (`Port_disabled`).
2. The port exists but is closed on the device side (`Port_added`, `Port_ready`, `Port_failed`).
3. The port exists and is open on the device side (`Port_open`).

The state transition table with `Port_added`, `Port_ready` and `Port_failed` as current state are thus identical.

Definition at line 195 of file `virtio-console`.

The documentation for this struct was generated from the following file:

- `l4/l4virtio/server/virtio-console`

## 16.390.1 Detailed Description

Base class implementing a virtio console functionality.

It is possible to activate the MULTIPORT feature, in which case incoming control messages need to be dispatched by calling `handle_control_message()`. The derived class must additionally override `process_device_ready()`, `process_port_ready()` and `process_port_open()` to implement the actual behaviour. The derived class has the following responsibilities:

- inform the driver about usable ports once the device is ready as signaled in `process_device_ready()`, see the wrapper `port_add()`.
- inform the driver about unusable ports, see the wrapper `port_remove()`.
- react to open/close events, see the wrapper `port_open()`.

This implementation provides no means to handle interrupts or notify guests, therefore derived classes have to provide this functionality, see `notify_queue()` and `handle_control_message()`. Similarly, all interaction with data queues has to be implemented. Memory for port structures must be managed by the implementor as well.

Use this class as a base to implement your own specific console device.

Definition at line 267 of file `virtio-console`.

## 16.390.2 Constructor & Destructor Documentation

### 16.390.2.1 Virtio\_con()

```
L4virtio::Svr::Console::Virtio_con::Virtio_con (
    unsigned max_ports,
    bool enable_multiport) [inline], [explicit]
```

Create a new multiport console device.

### Parameters

<i>max_ports</i>	Maximum number of ports the device should be able to handle (ignored when <code>enable_multiport</code> is false).
<i>enable_multiport</i>	Enable the control queue for dynamic handling of ports.

Definition at line 293 of file [virtio-console](#).

References [L4Re::chksys\(\)](#), [L4virtio::Svr::Console::Features::console\\_multiport\(\)](#), [L4\\_EINVAL](#), [L4VIRTIO\\_ID\\_CONSOLE](#), and [L4virtio::Svr::Dev\\_features::raw](#).

Here is the caller graph for this function:

## 16.390.3 Member Function Documentation

### 16.390.3.1 `handle_control_message()`

```
int L4virtio::Svr::Console::Virtio_con::handle_control_message () [inline]
```

Handle control message received from the driver.

#### Return values

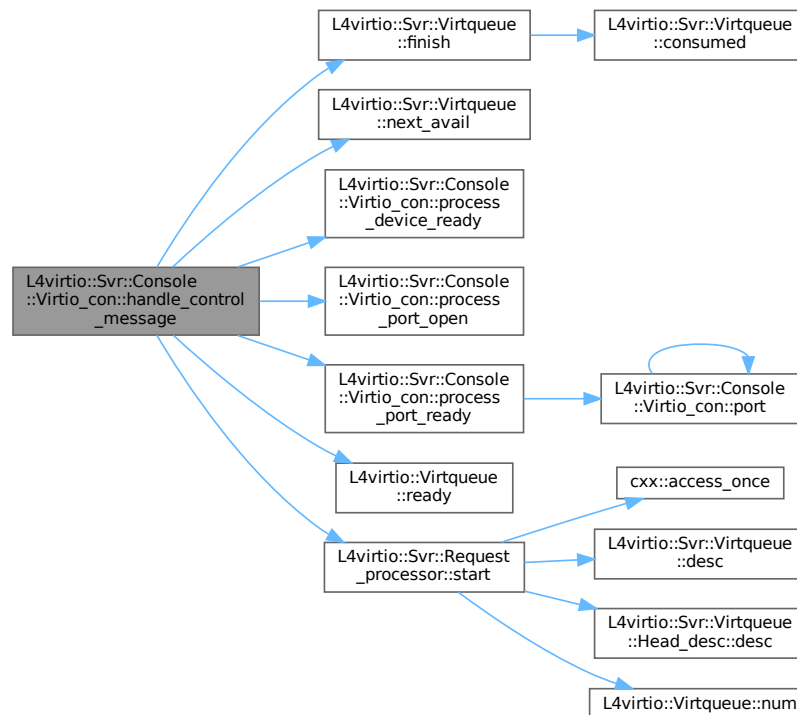

<code>L4_EOK</code>	Message has been handled.
<code>-L4_ENODEV</code>	Control queue is not ready.
<code>-L4_EINVAL</code>	Received an unexpected control event.

This function performs the basic handling of control messages from the driver. It does all necessary work with the control queues and performs some sanity checks. All other work is deferred to the derived class, see `process_device_ready()`, `process_port_ready()` and `process_port_open()`.

Definition at line 536 of file `virtio-console`.

References `L4virtio::Svr::Console::Control_message::Device_ready`, `L4virtio::Svr::Console::Control_message::event`, `L4virtio::Svr::Virtqueue::finish()`, `L4virtio::Svr::Console::Control_message::id`, `L4_EINVAL`, `L4_ENODEV`, `L4_EOK`, `L4virtio::Svr::Console::Control_request::len`, `L4virtio::Svr::Console::Control_request::msg`, `L4virtio::Svr::Virtqueue::next_avail()`, `L4virtio::Svr::Console::Port::Port_disabled`, `L4virtio::Svr::Console::Control_message::Port_open`, `L4virtio::Svr::Console::Port::Port_op`, `L4virtio::Svr::Console::Control_message::Port_ready`, `process_device_ready()`, `process_port_open()`, `process_port_ready()`, `L4virtio::Virtqueue::ready()`, `L4virtio::Svr::Request_processor::start()`, and `L4virtio::Svr::Console::Control_message::value`.

Here is the call graph for this function:

### 16.390.3.2 notify\_queue()

```
virtual void L4virtio::Svr::Console::Virtio_con::notify_queue (
    Virtqueue * queue) [pure virtual]
```

Notify queue of available data.

#### Parameters

<i>queue</i>	<a href="#">Virtqueue</a> to notify.
--------------	--------------------------------------

This callback is called whenever data is sent to `queue`. It is the responsibility of the derived class to perform all necessary notification actions, e.g. triggering guest interrupts.

Implemented in [L4virtio::Svr::Console::Device](#).

### 16.390.3.3 port()

```
virtual Port * L4virtio::Svr::Console::Virtio_con::port (
    unsigned port) [pure virtual]
```

Return the specified port.

#### Parameters

<i>port</i>	<a href="#">Port</a> number.
-------------	------------------------------

#### Precondition

[Port](#) number must be lower than the configured maximum number of ports.

Implemented in [L4virtio::Svr::Console::Device](#).

References [port\(\)](#).

Referenced by [check\\_queues\(\)](#), [port\(\)](#), [port\\_add\(\)](#), [port\\_name\(\)](#), [port\\_open\(\)](#), [port\\_remove\(\)](#), [process\\_port\\_ready\(\)](#), and [reset\(\)](#).

Here is the call graph for this function:

Here is the caller graph for this function:

### 16.390.3.4 port\_add()

```
int L4virtio::Svr::Console::Virtio_con::port_add (
    unsigned idx) [inline]
```

Send a DEVICE\_ADD message and update the internal state.

#### Parameters

<i>idx</i>	Port that should be added.
------------	----------------------------

#### Return values

<i>L4_EOK</i>	Message has been sent.
<i>-L4_EPERM</i>	Invalid state transition.

#### Precondition

*idx* must be smaller than the configured number of ports.

Port must not already exist.

Definition at line 379 of file [virtio-console](#).

### 16.390.3.5 port\_name()

```
int L4virtio::Svr::Console::Virtio_con::port_name (
    unsigned idx,
    char const * name) [inline]
```

Send a PORT\_NAME message to announce the port name.

#### Parameters

<i>idx</i>	<a href="#">Port</a> that should be opened or closed.
<i>name</i>	The port name

#### Return values

<i>L4_EOK</i>	Message has been sent.
<i>-L4_EPERM</i>	Control message is not allowed in the current state.

#### Returns

Errors from [send\\_control\\_message\(\)](#)

**Precondition**

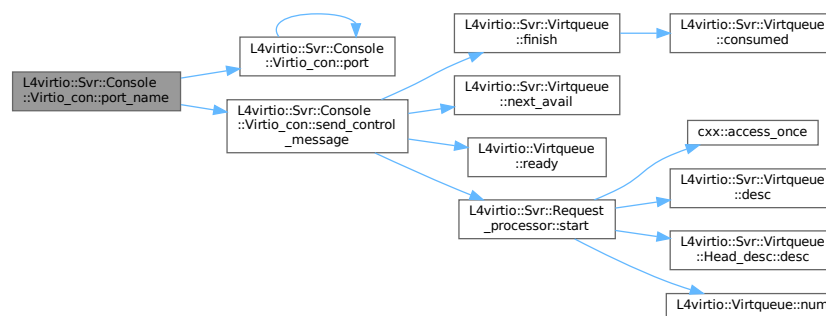

`idx` must be smaller than the configured number of ports.

[Port](#) must already exist.

Definition at line 455 of file [virtio-console](#).

**16.390.3.6 port\_open()**

```
int L4virtio::Svr::Console::Virtio_con::port_open (
    unsigned idx,
    bool open) [inline]
```

Send a PORT\_OPEN message and update the internal state.

**Parameters**

<i>idx</i>	<a href="#">Port</a> that should be opened or closed.
<i>open</i>	Open or close port.

**Return values**

<i>L4_EOK</i>	Message has been sent.
<i>-L4_EPERM</i>	Invalid state transition.

**Precondition**

`idx` must be smaller than the configured number of ports.

[Port](#) must be ready when opening or open when closing.

Definition at line 428 of file [virtio-console](#).

**16.390.3.7 port\_remove()**

```
int L4virtio::Svr::Console::Virtio_con::port_remove (
    unsigned idx) [inline]
```

Send a `DEVICE_REMOVE` message and update the internal state.

**Parameters**

<code>idx</code>	<a href="#">Port</a> that should be removed.
------------------	--

**Return values**

<code>L4_EOK</code>	Message has been sent.
<code>-L4_EPERM</code>	Invalid state transition.

**Precondition**

`idx` must be smaller than the configured number of ports.

`Port` must already exist.

Definition at line 403 of file `virtio-console`.

References `L4_EOK`, `L4_EPERM`, `port()`, `L4virtio::Svr::Console::Port::Port_disabled`, and `L4virtio::Svr::Console::Port::status`.

Here is the call graph for this function:

Here is the caller graph for this function:

**16.390.3.8 process\_device\_ready()**

```
virtual void L4virtio::Svr::Console::Virtio_con::process_device_ready (
    l4_uint16_t value) [pure virtual]
```

Callback called on `DEVICE_READY` event.

**Parameters**

<i>value</i>	The value field of the control message, indicating if the initialization was successful.
--------------	--

Needs to be overridden by the derived class if the MULTIPOINT feature is enabled. Control messages may be sent only after the driver has successfully initialized the device.

Implemented in [L4virtio::Svr::Console::Device](#).

Referenced by [handle\\_control\\_message\(\)](#).

Here is the caller graph for this function:

### 16.390.3.9 process\_port\_open()

```
virtual void L4virtio::Svr::Console::Virtio_con::process_port_open (
    l4_uint32_t id,
    l4_uint16_t value) [pure virtual]
```

Callback called on PORT\_OPEN event.

#### Parameters

<i>id</i>	The id field of the control message, i.e. the port number.
<i>value</i>	The value field of the control message, indicating if the port was opened or closed.

Signal that an application has opened the port. Can to be overridden by the derived class if the MULTIPOINT feature is enabled.

Implemented in [L4virtio::Svr::Console::Device](#).

Referenced by [handle\\_control\\_message\(\)](#).

Here is the caller graph for this function:

### 16.390.3.10 process\_port\_ready()

```
virtual void L4virtio::Svr::Console::Virtio_con::process_port_ready (
    14_uint32_t id,
    14_uint16_t value) [inline], [virtual]
```

Callback called on PORT\_READY event.

#### Parameters

<i>id</i>	The id field of the control message, i.e. the port number.
<i>value</i>	The value field of the control message, indicating if the initialization was successful.

May be overridden by the derived class if the MULTIPOINT feature is enabled. This default implementation just sets the status of the port according to the driver message.

Reimplemented in [L4virtio::Svr::Console::Device](#).

Definition at line 698 of file [virtio-console](#).

References [port\(\)](#), [L4virtio::Svr::Console::Port::Port\\_added](#), [L4virtio::Svr::Console::Port::Port\\_failed](#), [L4virtio::Svr::Console::Port::Port\\_ready](#), and [L4virtio::Svr::Console::Port::status](#).

Referenced by [handle\\_control\\_message\(\)](#), and [L4virtio::Svr::Console::Device::process\\_port\\_ready\(\)](#).

Here is the call graph for this function:

Here is the caller graph for this function:

**16.390.3.11 reset\_device()**

```
virtual void L4virtio::Svr::Console::Virtio_con::reset_device () [inline], [virtual]
```

Reset the state of the actual console device.

This callback is called at the end of `reset()`, allowing the derived class to reset internal state.

Definition at line 652 of file `virtio-console`.

Referenced by `reset()`.

Here is the caller graph for this function:

**16.390.3.12 send\_control\_message()**

```
int L4virtio::Svr::Console::Virtio_con::send_control_message (
    14_uint32_t idx,
    14_uint16_t event,
    14_uint16_t value = 0,
    const char * name = 0) [inline]
```

Send control message to driver.

**Parameters**

<i>idx</i>	Port number.
<i>event</i>	Kind of control event.
<i>value</i>	Extra information for the event.
<i>name</i>	Name to be used for Port_name message

**Return values**

<i>L4_EOK</i>	Message has been sent.
<i>-L4_ENODEV</i>	Control queue is not ready.
<i>-L4_EBUSY</i>	Currently no descriptor available in the control queue.
<i>-L4_ENOMEM</i>	Client-issued descriptor too small. Device will be set to failed state.

**Precondition**

`port` must be smaller than the configured number of ports.

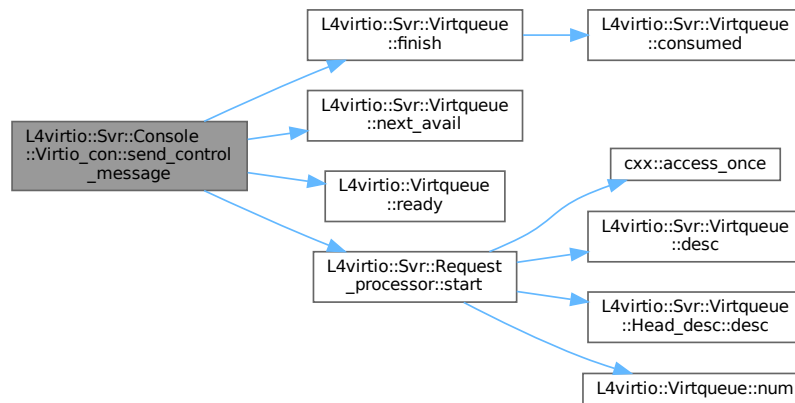

The convenience functions `port_add()`, `port_remove()` and `port_open()` should cover the most use cases and are the preferred way of communication with the driver. If you use this function directly, it is your responsibility to guarantee no invalid control messages are sent to the driver.

Definition at line 487 of file `virtio-console`.

### 16.391.2.1 Data\_buffer()

```
template<typename T>
L4virtio::Svr::Data_buffer::Data_buffer (
    T * p) [inline], [explicit]
```

Create buffer for object p.

## Template Parameters

<i>T</i>	Type of object (implicit)
----------	---------------------------

## Parameters

<i>p</i>	Pointer to object.
----------	--------------------

The buffer shall point to the start of the object p and the size left is sizeof(T).

Definition at line 323 of file [virtio](#).

References [left](#), and [pos](#).

## 16.391.3 Member Function Documentation

### 16.391.3.1 copy\_to()

```
l4_uint32_t L4virtio::Svr::Data_buffer::copy_to (
    Data_buffer * dst,
    l4_uint32_t max = UINT_MAX) [inline]
```

Copy contents from this buffer to the destination buffer.

#### Parameters

<i>dst</i>	Destination buffer.
<i>max</i>	(optional) Maximum number of bytes to copy.

#### Returns

the number of bytes copied.

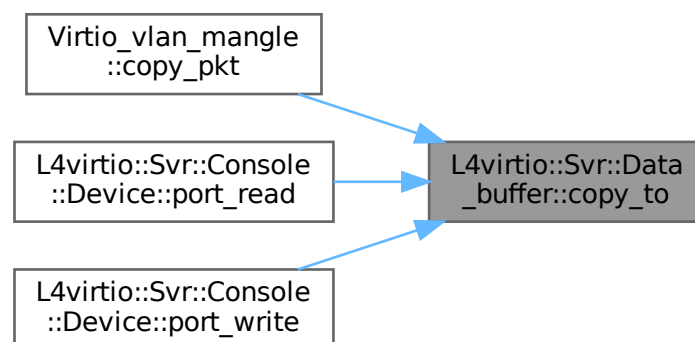

This function copies at most `max` bytes from this to `dst`. If `max` is omitted, copies the maximum number of bytes available that fit `dst`.

Definition at line 354 of file [virtio](#).

References [left](#), and [pos](#).

Referenced by [Virtio\\_vlan\\_mangle::copy\\_pkt\(\)](#), [L4virtio::Svr::Console::Device::port\\_read\(\)](#), and [L4virtio::Svr::Console::Device::port\\_w](#)

References [left](#).

**16.391.3.3 set()**

```
template<typename T>
void L4virtio::Svr::Data_buffer::set (
    T * p) [inline]
```

Set buffer for object p.

**Template Parameters**

<i>T</i>	Type of object (implicit)
----------	---------------------------

**Parameters**

<i>p</i>	Pointer to object.
----------	--------------------

The buffer shall point to the start of the object p and the size left is sizeof(T).

Definition at line 337 of file [virtio](#).

References [left](#), and [pos](#).

**16.391.3.4 skip()**

```
l4_uint32_t L4virtio::Svr::Data_buffer::skip (
    l4_uint32_t bytes) [inline]
```

Skip given number of bytes in this buffer.

**Parameters**

<i>bytes</i>	Number of bytes that shall be skipped.
--------------	--

### Returns

The number of bytes skipped.

Try to skip the given number of bytes in this buffer, if there are less bytes left in the buffer that given then at most left bytes are skipped and the amount is returned.

Definition at line 375 of file [virtio](#).

References [left](#), and [pos](#).

## 16.392.1 Detailed Description

Abstraction for L4-Virtio device config memory.

Virtio defines a device configuration mechanism, L4-Virtio implements this mechanism based on shared memory a [set\\_status\(\)](#) and a [config\\_queue\(\)](#) call. This class provides an abstraction for L4-Virtio host implementations to establish such a shared memory data space and providing the necessary contents and access functions.

Definition at line 52 of file [l4virtio](#).

## 16.392.2 Constructor & Destructor Documentation

### 16.392.2.1 Dev\_config() [1/2]

```
L4virtio::Svr::Dev_config::Dev_config (
    l4\_uint32\_t vendor,
    l4\_uint32\_t device,
    unsigned cfg_size,
    l4\_uint32\_t num_queues = 0) [inline]
```

Create a L4-Virtio config data space.

#### Parameters

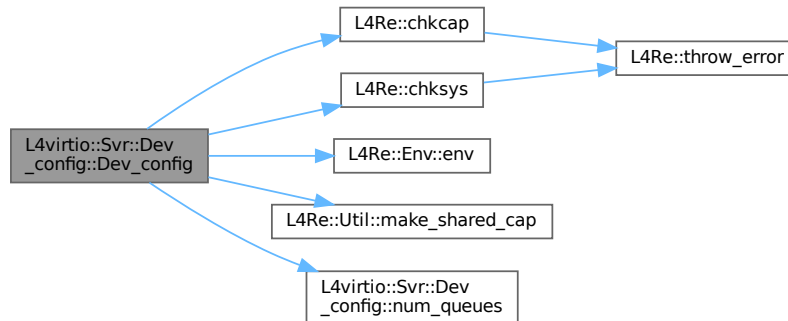

<i>vendor</i>	The vendor ID to store in config header.
<i>device</i>	The device ID to store in config header.
<i>cfg_size</i>	The size of the device-specific config data in bytes.
<i>num_queues</i>	The number of queues provided by the device.

This constructor allocates a data space used for L4-virtio config attaches the data space to the local address space and writes the initial contents to the config header.

Definition at line 112 of file [l4virtio](#).

References [L4Re::chkcap\(\)](#), [L4Re::chksys\(\)](#), [L4Re::Env::env\(\)](#), [L4\\_PAGESIZE](#), [L4Re::Util::make\\_shared\\_cap\(\)](#), and [num\\_queues\(\)](#).

Here is the call graph for this function:

### 16.392.2.2 Dev\_config() [2/2]

```

L4virtio::Svr::Dev_config::Dev_config (
    Cfg_cap const & cfg,
    14_addr_t  cfg_offset,
    14_uint32_t vendor,
    14_uint32_t device,
    unsigned  cfg_size,
    14_uint32_t num_queues = 0) [inline]
  
```

Setup an L4-Virtio config space in an existing data space.

#### Parameters

<i>cfg</i>	Dataspace that should hold the L4-Virtio configuration.
<i>cfg_offset</i>	Offset into the dataspace where the configuration starts.
<i>vendor</i>	The vendor ID to store in config header.
<i>device</i>	The device ID to store in config header.
<i>cfg_size</i>	The size of the device-specific config data in bytes.
<i>num_queues</i>	The number of queues provided by the device.

Definition at line 146 of file [l4virtio](#).

References [L4\\_PAGESIZE](#), and [num\\_queues\(\)](#).

Here is the call graph for this function:

## 16.392.3 Member Function Documentation

### 16.392.3.1 add\_irq\_status()

```
void L4virtio::Svr::Dev_config::add_irq_status (
    14_uint32_t status) [inline]
```

Adds irq status bit.

#### Parameters

<i>status</i>	The value to add to the irq status register.
---------------	--

This function adds the status bit to the irq status register.

Definition at line 265 of file [l4virtio](#).

References [hdr\(\)](#), and [status\(\)](#).

Here is the call graph for this function:

### 16.392.3.2 change\_queue\_config()

```
bool L4virtio::Svr::Dev_config::change_queue_config (
    14_uint32_t num_queues) [inline]
```

Setup new queue configuration.

#### Parameters

<code>num_queues</code>	The number of queues provided by the device.
-------------------------	--

Definition at line 286 of file [l4virtio](#).

References [L4\\_PAGESIZE](#), [num\\_queues\(\)](#), and [reset\\_hdr\(\)](#).

Here is the call graph for this function:

### 16.392.3.3 ds()

```
L4::Cap< L4Re::Dataspace > L4virtio::Svr::Dev_config::ds () const [inline]
```

Get data-space capability for the shared config data space.

Returns

Capability for the shared config data space.

Definition at line 375 of file [l4virtio](#).

### 16.392.3.4 get\_cmd()

```
l4_uint32_t L4virtio::Svr::Dev_config::get_cmd () const [inline]
```

Get the value from the `cmd` register.

Note, the most significant eight bits are the command (0 is nothing to do). The upper eight bit are reset to zero after the command was handled.

Definition at line 230 of file [l4virtio](#).

References [hdr\(\)](#).

Here is the call graph for this function:

### 16.392.3.5 guest\_features()

```
l4_uint32_t L4virtio::Svr::Dev_config::guest_features (
    unsigned idx) const [inline]
```

Return a specific set of guest features.

#### Parameters

<i>idx</i>	Index into the guest features array.
------------	--------------------------------------

#### Return values

<i>The</i>	selected set of guest features.
------------	---------------------------------

This function returns a specific 32bit set of features enabled by the guest/driver. *idx* is the index in the guest features array, resp. the 32 bit set to return.

Definition at line 198 of file [l4virtio](#).

### 16.392.3.6 hdr()

```
l4virtio_config_hdr_t const volatile * L4virtio::Svr::Dev_config::hdr () const [inline]
```

Get a read-only pointer to the config header.

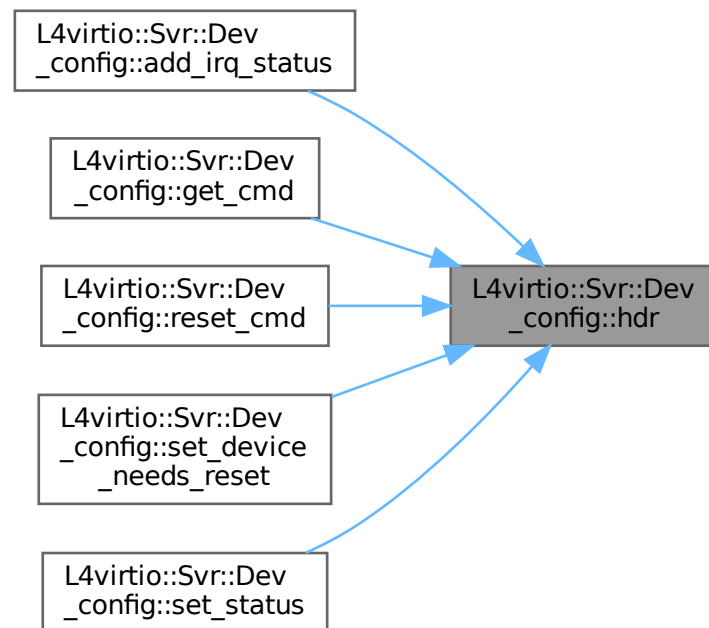

#### Returns

Read-only pointer to the shared config header.

Definition at line 368 of file [l4virtio](#).

Referenced by [add\\_irq\\_status\(\)](#), [get\\_cmd\(\)](#), [reset\\_cmd\(\)](#), [set\\_device\\_needs\\_reset\(\)](#), and [set\\_status\(\)](#).

Here is the caller graph for this function:

### 16.392.3.7 negotiated\_features()

```
l4_uint32_t L4virtio::Svr::Dev_config::negotiated_features (
    unsigned idx) const [inline]
```

Compute a specific set of negotiated features.

#### Parameters

<i>idx</i>	Index into the guest/host features array.
------------	---

#### Return values

<i>The</i>	selected set of negotiated features.
------------	--------------------------------------

This function returns a specific 32-bit set of features negotiated by the guest/driver and host/device. *idx* is the index in the guest/host features array, resp. the 32-bit set to return.

Definition at line 212 of file [l4virtio](#).

**16.392.3.8 qconfig()**

```
l4virtio_config_queue_t volatile const * L4virtio::Svr::Dev_config::qconfig (
    unsigned index) const [inline]
```

Get queue read-only config data for queue with the given *index*.

**Parameters**

<i>index</i>	The index of the queue.
--------------	-------------------------

**Returns**

Read-only pointer to the config of the queue with the given *index*, or NULL if *index* is out of range.

Definition at line 303 of file [l4virtio](#).

References [L4\\_UNLIKELY](#).

Referenced by [reset\\_queue\(\)](#).

Here is the caller graph for this function:

**16.392.3.9 reset\_cmd()**

```
void L4virtio::Svr::Dev_config::reset_cmd () [inline]
```

Reset the `cmd` register after execution of a command.

This function resets the `cmd` register in order for the client to detect that the command was executed by the device.

Definition at line 241 of file [l4virtio](#).

References [hdr\(\)](#).

Here is the call graph for this function:

**16.392.3.10 reset\_queue()**

```
bool L4virtio::Svr::Dev_config::reset_queue (
    unsigned index,
    unsigned num_max,
    bool inc_generation = false) const [inline]
```

Reset queue config for the given queue.

**Parameters**

<i>index</i>	The index of the queue to reset.
<i>num_max</i>	The maximum number of descriptors supported by this queue.
<i>inc_generation</i>	The config generation will be incremented when this is true.

**Returns**

true on success, or false when *index* is out of range.

Definition at line 345 of file [l4virtio](#).

References [L4\\_UNLIKELY](#), [l4virtio\\_config\\_queue\\_t::num](#), [l4virtio\\_config\\_queue\\_t::num\\_max](#), [qconfig\(\)](#), and [l4virtio\\_config\\_queue\\_t::ready](#).

Here is the call graph for this function:

**16.392.3.11 set\_device\_needs\_reset()**

```
void L4virtio::Svr::Dev_config::set_device_needs_reset () [inline]
```

Set `DEVICE_NEEDS_RESET` bit in device status register.

This function sets the internal status register and also the status register in the shared memory to `DEVICE_NEEDS_RESET`.

Definition at line 276 of file [l4virtio](#).

References [hdr\(\)](#).

Here is the call graph for this function:

### 16.392.3.12 set\_status()

```
void L4virtio::Svr::Dev_config::set_status (  
    Status status) [inline]
```

Set device status register.

#### Parameters

<i>status</i>	The new value for the device status register.
---------------	---

This function sets the internal status register and also the status register in the shared memory to *status*.

Definition at line 253 of file [l4virtio](#).

References [hdr\(\)](#), and [status\(\)](#).

Here is the call graph for this function:

**16.392.3.13 status()**

```
Status L4virtio::Svr::Dev_config::status () const [inline]
```

Get current device status (trusted).

**Returns**

Current device status register (trusted).

The status returned by this function is value stored internally and cannot be written by the guest (i.e., the value can be taken as trusted.)

Definition at line 222 of file [l4virtio](#).

Referenced by [add\\_irq\\_status\(\)](#), and [set\\_status\(\)](#).

Here is the caller graph for this function:

The documentation for this class was generated from the following file:

## 16.394.1 Detailed Description

Type of the device status register.

Definition at line 32 of file [virtio](#).

## 16.394.2 Member Function Documentation

### 16.394.2.1 running()

```
bool L4virtio::Svr::Dev_status::running () const [inline]
```

Check if the device is in running state.

#### Returns

true if the device is in running state.

The device is in running state when [acked\(\)](#), [driver\(\)](#), [features\\_ok\(\)](#), and [driver\\_ok\(\)](#) return true, and [device\\_needs\\_reset\(\)](#) and [failed\(\)](#) return false.

## 16.395.1 Detailed Description

```
template<typename DATA>
class L4virtio::Svr::Device_t< DATA >
```

Server-side L4-VIRTIO device stub.

This stub supports new-style multi-event registration (using `get_device_config()`, `bind()` and `get_device_notification_irq()`).

Definition at line 801 of file [l4virtio](#).

## 16.395.2 Member Function Documentation

### 16.395.2.1 add\_trusted\_dataspaces()

```
template<typename DATA>
void L4virtio::Svr::Device_t< DATA >::add_trusted_dataspaces (
    std::shared_ptr< Ds_vector const > ds) [inline]
```

Provide a list of trusted dataspaces that can be used for validation.

#### Parameters

---

<i>ds</i>	list of trusted dataspaces.
-----------	-----------------------------

Definition at line 1198 of file [l4virtio](#).

### 16.395.2.2 device\_error()

```
template<typename DATA>
void L4virtio::Svr::Device_t< DATA >::device_error () [inline]
```

Transition device into DEVICE\_NEEDS\_RESET state.

This function does a full reset, sets the DEVICE\_NEEDS\_RESET bit in the device status register, triggering a guest config IRQ if necessary. The driver still needs to perform its own reset and initialization sequence.

Definition at line 1024 of file [l4virtio](#).

Referenced by [Virtio\\_switch::handle\\_l4virtio\\_port\\_tx\(\)](#).

Here is the caller graph for this function:

### 16.395.2.3 device\_notify\_irq()

```
template<typename DATA>
virtual L4::Cap< L4::Irq > L4virtio::Svr::Device_t< DATA >::device_notify_irq (
    unsigned idx) [inline], [virtual]
```

Callback to gather the device notification IRQ (multi IRQ).

The default implementation maps to the implementation for single IRQ notification points.

Definition at line 874 of file [l4virtio](#).

### 16.395.2.4 handle\_mem\_cmd\_write()

```
template<typename DATA>
bool L4virtio::Svr::Device_t< DATA >::handle_mem_cmd_write () [inline]
```

Check for a value in the `cmd` register and handle a write.

This function checks for a value in the `cmd` register and executes the command if there is any, or returns false if there was no command.

Execution of the command is signaled by a zero in the `cmd` register.

Definition at line 1154 of file [l4virtio](#).

### 16.395.2.5 `init_mem_info()`

```
template<typename DATA>
void L4virtio::Svr::Device_t< DATA >::init_mem_info (
    unsigned num) [inline]
```

Initialize the memory region list to the given maximum.

#### Parameters

<i>num</i>	Maximum number of memory regions that can be managed.
------------	---

Definition at line 1012 of file [l4virtio](#).

### 16.395.2.6 `register_driver_irq()`

```
template<typename DATA>
virtual void L4virtio::Svr::Device_t< DATA >::register_driver_irq (
    unsigned idx) [inline], [virtual]
```

Callback for registering an notification IRQ (multi IRQ).

The default implementation maps to the implementation for single IRQ notification points.

Definition at line 860 of file [l4virtio](#).

### 16.395.2.7 `reset_queue_config()`

```
template<typename DATA>
void L4virtio::Svr::Device_t< DATA >::reset_queue_config (
    unsigned idx,
    unsigned num_max,
    bool inc_generation = false) [inline]
```

Trigger reset for the configuration space for queue *idx*.

#### Parameters

<i>idx</i>	The queue index to reset.
<i>num_max</i>	Maximum number of entries in this queue.
<i>inc_generation</i>	The config generation will be incremented when this is true.

This function resets the driver-readable configuration space for the queue with the given index. The queue configuration is reset to all 0, and the maximum number of entries in the queue is set to *num\_max*.

Definition at line 1002 of file [l4virtio](#).

### 16.395.2.8 setup\_queue()

```
template<typename DATA>
bool L4virtio::Svr::Device_t< DATA >::setup_queue (
    Virtqueue * q,
    unsigned qn,
    unsigned num_max) [inline]
```

Enable/disable the specified queue.

#### Parameters

---

<i>q</i>	Pointer to the ring that represents the virtqueue internally.
<i>qn</i>	Index of the queue.
<i>num_max</i>	Maximum number of supported entries in this queue.

#### Returns

true for success.

- This function calculates the parameters of the virtqueue from the clients configuration space values, checks the accessibility of the queue data structures and initializes *q* to ready state when all checks succeeded.

Definition at line [1047](#) of file [l4virtio](#).

## 16.396.1 Detailed Description

```
template<typename DATA>
class L4virtio::Svr::Driver_mem_list_t< DATA >
```

List of driver memory regions assigned to a single L4-VIRTIO transport instance.

### Note

The regions added to this list *must* never overlap.

Definition at line 629 of file [l4virtio](#).

## 16.396.2 Member Function Documentation

### 16.396.2.1 add()

```
template<typename DATA>
Mem_region const * L4virtio::Svr::Driver_mem_list_t< DATA >::add (
    l4_uint64_t drv_base,
    l4_umword_t size,
    l4_addr_t offset,
    Ds_cap && ds) [inline]
```

Add a new region to the list.

### Parameters

<i>drv_base</i>	Driver base address of the region.
<i>size</i>	Size of the region in bytes.
<i>offset</i>	Offset within the data space attached to <i>drv_base</i> .
<i>ds</i>	Data space backing the driver memory.

### Returns

A pointer to the new region.

Definition at line 669 of file [l4virtio](#).

### 16.396.2.2 find()

```
template<typename DATA>
Mem_region * L4virtio::Svr::Driver_mem_list_t< DATA >::find (
    l4_uint64_t base,
    l4_umword_t size) const [inline]
```

Find memory region containing the given driver address region.

### Parameters

---

<i>base</i>	Driver base address.
<i>size</i>	Size of the region.

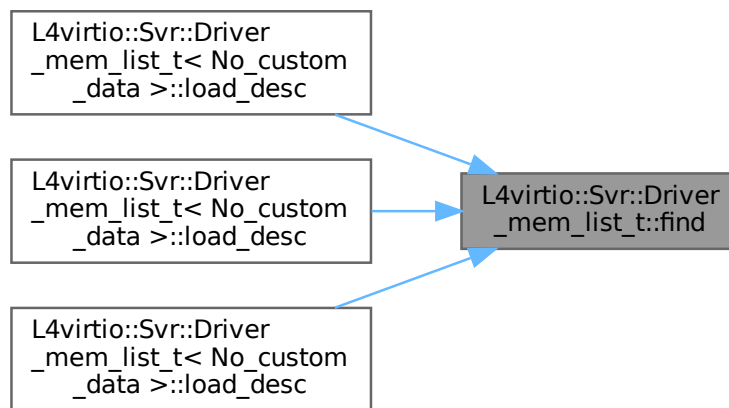

### Returns

Pointer to the region containing the given region, NULL if none is found.

Definition at line 703 of file [l4virtio](#).

Referenced by [L4virtio::Svr::Driver\\_mem\\_list\\_t< No\\_custom\\_data >::load\\_desc\(\)](#), [L4virtio::Svr::Driver\\_mem\\_list\\_t< No\\_custom\\_data >::load\\_desc\(\)](#) and [L4virtio::Svr::Driver\\_mem\\_list\\_t< No\\_custom\\_data >::load\\_desc\(\)](#).

Here is the caller graph for this function:

### 16.396.2.3 full()

```
template<typename DATA>
bool L4virtio::Svr::Driver_mem_list_t< DATA >::full () const [inline]
```

### Returns

True if the remaining capacity is 0.

Definition at line 658 of file [l4virtio](#).

Referenced by [L4virtio::Svr::Driver\\_mem\\_list\\_t< No\\_custom\\_data >::add\(\)](#).

Here is the caller graph for this function:

#### 16.396.2.4 init()

```
template<typename DATA>
void L4virtio::Svr::Driver_mem_list_t< DATA >::init (
    unsigned max) [inline]
```

Make a fresh list with capacity *max*.

##### Parameters

<i>max</i>	The capacity of this vector.
------------	------------------------------

Definition at line 650 of file [l4virtio](#).

#### 16.396.2.5 load\_desc() [1/3]

```
template<typename DATA>
template<typename ARG>
void L4virtio::Svr::Driver_mem_list_t< DATA >::load_desc (
    Virtqueue::Desc const & desc,
    Request_processor const * p,
    ARG * data) const [inline]
```

Default implementation returning generic information.

##### Template Parameters

<i>ARG</i>	Abstract argument type used with <a href="#">Request_processor::start()</a> and <a href="#">Request_processor::next()</a> to deliver the result of loading a descriptor. This type must provide a constructor taking three arguments: (1) pointer to a <code>Driver_mem_region</code> , (2) the <a href="#">Virtqueue::Desc</a> descriptor, and (3) a pointer to the calling <a href="#">Request_processor</a> .
------------	--

##### Parameters

	<i>desc</i>	The descriptor to load
--	-------------	------------------------

	<i>p</i>	The request processor calling us
out	<i>data</i>	Shall be assigned to ARG(mem, desc, p)

### Exceptions

<a href="#">Bad_descriptor</a>	The descriptor address could not be translated.
--------------------------------	---

Definition at line 764 of file [l4virtio](#).

#### 16.396.2.6 load\_desc() [2/3]

```
template<typename DATA>
void L4virtio::Svr::Driver_mem_list_t< DATA >::load_desc (
    Virtqueue::Desc const & desc,
    Request_processor const * p,
    Mem_region const ** data) const [inline]
```

Default implementation returning the Driver\_mem\_region.

### Parameters

	<i>desc</i>	The descriptor to load
	<i>p</i>	The request processor calling us
out	<i>data</i>	Shall be set to a pointer to the Driver_mem_region that covers the descriptor.

### Exceptions

<a href="#">Bad_descriptor</a>	The descriptor address could not be translated.
--------------------------------	---

Definition at line 737 of file [l4virtio](#).

#### 16.396.2.7 load\_desc() [3/3]

```
template<typename DATA>
void L4virtio::Svr::Driver_mem_list_t< DATA >::load_desc (
    Virtqueue::Desc const & desc,
    Request_processor const * p,
    Virtqueue::Desc const ** table) const [inline]
```

Default implementation for loading an indirect descriptor.

### Parameters

	<i>desc</i>	The descriptor to load
--	-------------	------------------------

	<i>p</i>	The request processor calling us
out	<i>table</i>	Shall be set to the loaded descriptor table

### Exceptions

<a href="#"><i>Bad_descriptor</i></a>	The descriptor address could not be translated.
---------------------------------------	---

Definition at line 717 of file [l4virtio](#).

#### 16.396.2.8 remove()

```
template<typename DATA>
void L4virtio::Svr::Driver_mem_list_t< DATA >::remove (
    Mem_region const * r) [inline]
```

Remove the given region from the list.

### Parameters

<i>r</i>	The region to remove (result from <a href="#">add()</a> , or <a href="#">find()</a> ).
----------	--

Definition at line 683 of file [l4virtio](#).

The documentation for this class was generated from the following file:

### 16.397.1 Detailed Description

template<typename DATA>  
class L4virtio::Svr::Driver\_mem\_region\_t< DATA >

Region of driver memory, that shall be managed locally.

### Template Parameters

---

<i>DATA</i>	Class defining additional information
-------------	---------------------------------------

Definition at line 450 of file [l4virtio](#).

## 16.397.2 Constructor & Destructor Documentation

### 16.397.2.1 Driver\_mem\_region\_t()

```
template<typename DATA>
L4virtio::Svr::Driver_mem_region_t< DATA >::Driver_mem_region_t (
    l4_uint64_t drv_base,
    l4_umword_t size,
    l4_addr_t offset,
    Ds_cap && ds) [inline]
```

Make a local memory region for the given driver values.

#### Parameters

<i>drv_base</i>	Base address of the memory region used by the driver.
<i>size</i>	Size of the memory region.
<i>offset</i>	Offset within the data space that is mapped to <i>drv_base</i> within the driver.
<i>ds</i>	Data space capability backing the memory.

This constructor attaches the region of given data space to the local address space and stores the corresponding data for later reference.

Definition at line 498 of file [l4virtio](#).

## 16.397.3 Member Function Documentation

### 16.397.3.1 contains()

```
template<typename DATA>
bool L4virtio::Svr::Driver_mem_region_t< DATA >::contains (
    l4_uint64_t base,
    l4_umword_t size) const [inline]
```

Test if the given driver address range is within this region.

#### Parameters

<i>base</i>	The driver base address.
<i>size</i>	The size of the region to lookup.

#### Returns

true if the given driver address region is contained in this region, false else.

Definition at line 592 of file [l4virtio](#).

### 16.397.3.2 drv\_base()

```
template<typename DATA>
l4_uint64_t L4virtio::Svr::Driver_mem_region_t< DATA >::drv_base () const [inline]
```

#### Returns

The base address used by the driver.

Definition at line 571 of file [l4virtio](#).

### 16.397.3.3 ds()

```
template<typename DATA>
L4::Cap< L4Re::Dataspace > L4virtio::Svr::Driver_mem_region_t< DATA >::ds () const [inline]
```

#### Returns

The data space capability for this region.

Definition at line 583 of file [l4virtio](#).

### 16.397.3.4 ds\_offset()

```
template<typename DATA>
l4_addr_t L4virtio::Svr::Driver_mem_region_t< DATA >::ds_offset () const [inline]
```

#### Returns

The offset within the data space.

Definition at line 580 of file [l4virtio](#).

### 16.397.3.5 empty()

```
template<typename DATA>
bool L4virtio::Svr::Driver_mem_region_t< DATA >::empty () const [inline]
```

#### Returns

True if the region is empty (size == 0), false otherwise.

Definition at line 567 of file [l4virtio](#).

**16.397.3.6 flags()**

```
template<typename DATA>
Flags L4virtio::Svr::Driver_mem_region_t< DATA >::flags () const [inline]
```

**Returns**

The flags for this region.

Definition at line 564 of file [l4virtio](#).

**16.397.3.7 is\_writable()**

```
template<typename DATA>
bool L4virtio::Svr::Driver_mem_region_t< DATA >::is_writable () const [inline]
```

**Returns**

True if the region is writable, false otherwise.

Definition at line 561 of file [l4virtio](#).

**16.397.3.8 local()**

```
template<typename DATA>
template<typename T>
T * L4virtio::Svr::Driver_mem_region_t< DATA >::local (
    Ptr< T > p) const [inline]
```

Get the local address for driver address *p*.

**Parameters**

<i>p</i>	Driver address to translate.
----------	------------------------------

**Precondition**

*p must* be contained in this region.

**Returns**

Local address for the given driver address *p*.

Definition at line 616 of file [l4virtio](#).

Referenced by [L4virtio::Svr::Driver\\_mem\\_list\\_t< No\\_custom\\_data >::load\\_desc\(\)](#).

- `template<typename DESC_MAN, typename ... ARGS>`  
`bool next (DESC_MAN *dm, ARGS... args)`  
*Switch to the next descriptor in a descriptor chain.*

### 16.398.1 Detailed Description

Encapsulate the state for processing a VIRTIO request.

A VIRTIO request is a possibly chained list of descriptors retrieved from the available ring of a virtqueue, using `Virtqueue::next_avail()`.

The descriptor processing depends on helper (DESC\_MAN) for interpreting the descriptors in the context of the device implementation.

DESC\_MAN has to provide the functionality to safely dereference a descriptor from a descriptor list.

The following methods must be provided by DESC\_MAN:

- `DESC_MAN::load_desc (Virtqueue::Desc const &desc,`  
`Request_processor const *proc,`  
`Virtqueue::Desc const **table)`

This function is used to dereference `desc` as an indirect descriptor table, and must return a pointer to an indirect descriptor table.

- `DESC_MAN::load_desc(Virtqueue::Desc const &desc, Request_processor const *proc, ...)`

This function is used to dereference a descriptor as a normal data buffer, and '...' are the arguments that are passed to `start()` and `next()`.

Definition at line 472 of file [virtio](#).

## 16.398.2 Member Function Documentation

### 16.398.2.1 `current_flags()`

```
Virtqueue::Desc::Flags L4virtio::Svr::Request_processor::current_flags () const [inline]
```

Get the flags of the currently processed descriptor.

#### Returns

The flags of the currently processed descriptor.

Definition at line 545 of file [virtio](#).

Referenced by [L4virtio::Svr::Virtio\\_gpio< Request\\_handler, Epiface >::Request\\_processor::get\\_request\(\)](#).

Here is the caller graph for this function:

### 16.398.2.2 `has_more()`

```
bool L4virtio::Svr::Request_processor::has_more () const [inline]
```

Are there more chained descriptors?

#### Returns

true if there are more chained descriptors in the current request.

Definition at line 553 of file [virtio](#).

Referenced by [L4virtio::Svr::Block\\_request< Ds\\_data >::data\\_size\(\)](#).

Here is the caller graph for this function:

### 16.398.2.3 next()

```
template<typename DESC_MAN, typename ... ARGS>
bool L4virtio::Svr::Request_processor::next (
    DESC_MAN * dm,
    ARGS... args) [inline]
```

Switch to the next descriptor in a descriptor chain.

#### Template Parameters

<i>DESC_MAN</i>	Type of descriptor manager (implicit).
-----------------	--

#### Parameters

<i>dm</i>	Descriptor manager that is used to translate VIRTIO descriptor addresses.
<i>args</i>	Extra arguments passed to dm->load_desc()

#### Return values

<i>true</i>	A next descriptor is available.
<i>false</i>	No descriptor available.

#### Exceptions

<a href="#"><i>Bad_descriptor</i></a>	The <a href="#">next</a> index of this descriptor is invalid.
---------------------------------------	---

Definition at line 570 of file [virtio](#).

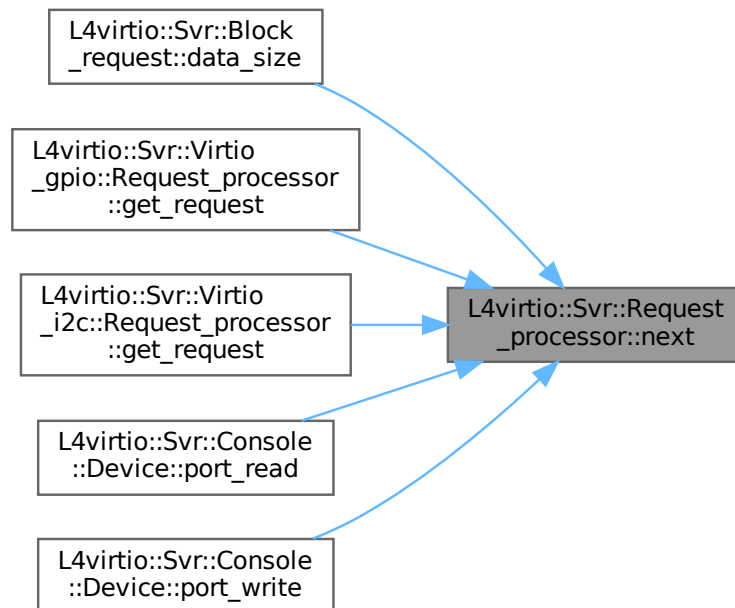

References [cxx::access\\_once\(\)](#), [L4virtio::Svr::Bad\\_descriptor::Bad\\_flags](#), [L4virtio::Svr::Bad\\_descriptor::Bad\\_next](#), and [L4\\_UNLIKELY](#).

#### 16.398.2.4 start() [1/2]

```

template<typename DESC_MAN, typename ... ARGS>
void L4virtio::Svr::Request_processor::start (
    DESC_MAN * dm,
    Virtqueue * ring,
    Virtqueue::Head_desc const & request,
    ARGS... args) [inline]

```

Start processing a new request.

#### Template Parameters

<i>DESC_MAN</i>	Type of descriptor manager (implicit).
-----------------	--

#### Parameters

<i>dm</i>	Descriptor manager that is used to translate VIRTIO descriptor addresses.
<i>ring</i>	VIRTIO ring of the request.
<i>request</i>	VIRTIO request from <a href="#">Virtqueue::next_avail()</a>
<i>args</i>	Extra arguments passed to <code>dm-&gt;load_desc()</code>

### Precondition

The given request must be valid.

### Exceptions

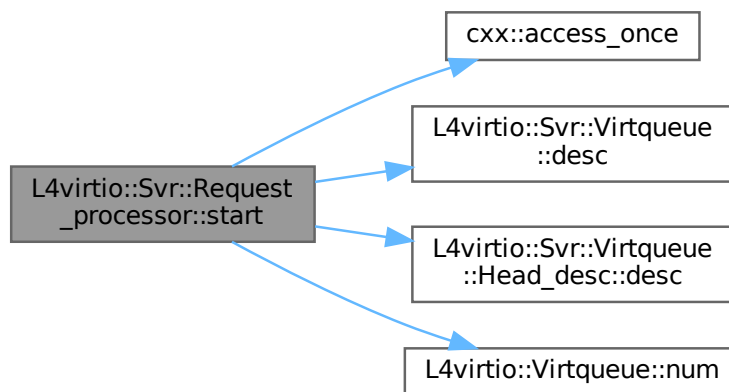

<a href="#">Bad_descriptor</a>	The descriptor has an invalid size or load_desc() has thrown an exception by itself.
--------------------------------	--

### 16.407.1 Detailed Description

A server implementation of the virtio-scmi protocol.

Use this class as a base to implement your own specific SCMI device.

SCMI defines multiple protocols which can be optionally handled. This server implementation is flexible enough to handle any combination of them. The user of this server has to deviate from the provided **Proto** classes (for the protocols he want to handle) and needs to implement the required callbacks.

Right now, support for the base and the performance protocol is provided.

The base protocol is mandatory.

If you want to use this from a Uvmm Linux guest, the device tree needs to look something like this:

```

firmware {
    scmi {
        compatible = "arm,scmi-virtio";

        #address-cells = <1>;
        #size-cells = <0>;

        // ... supported protocols ...
    };
};

```

*Memory region list.*

## 16.409.1 Detailed Description

```
template<typename Request_handler, typename Epiface = L4virtio::Device>
class L4virtio::Svr::Virtio\_gpio< Request_handler, Epiface >
```

A server implementation of the virtio-gpio protocol.

## Template Parameters

---

<i>Request_handler</i>	<p>The type that is used to handle incoming requests. Needs to have:</p> <ul style="list-style-type: none"> <li>• <code>bool get_direction(l4_uint16_t gpio, l4_uint8_t *dir)</code></li> <li>• <code>bool set_direction(l4_uint16_t gpio, l4_uint8_t dir)</code></li> <li>• <code>bool get_value(l4_uint16_t gpio, l4_uint8_t *val)</code></li> <li>• <code>bool set_value(l4_uint16_t gpio, l4_uint8_t val)</code></li> <li>• <code>bool set_irq_type(l4_uint16_t gpio, l4_uint8_t mode)</code></li> <li>• <code>bool enable_irq(l4_uint16_t gpio, std::shared_ptr&lt;Virtio_gpio::Irq_handler&gt; const &amp;hdl)</code> functions.</li> </ul>
<i>Epiface</i>	The Epiface to derive from. Defaults to <a href="#">L4virtio::Device</a> .

Definition at line 142 of file [virtio-gpio-device](#).

The documentation for this class was generated from the following file:

- `l4/l4virtio/server/virtio-gpio-device`

## 16.410 L4virtio::Svr::Virtio\_gpio< Request\_handler, Epiface >::Host\_irq Struct Reference

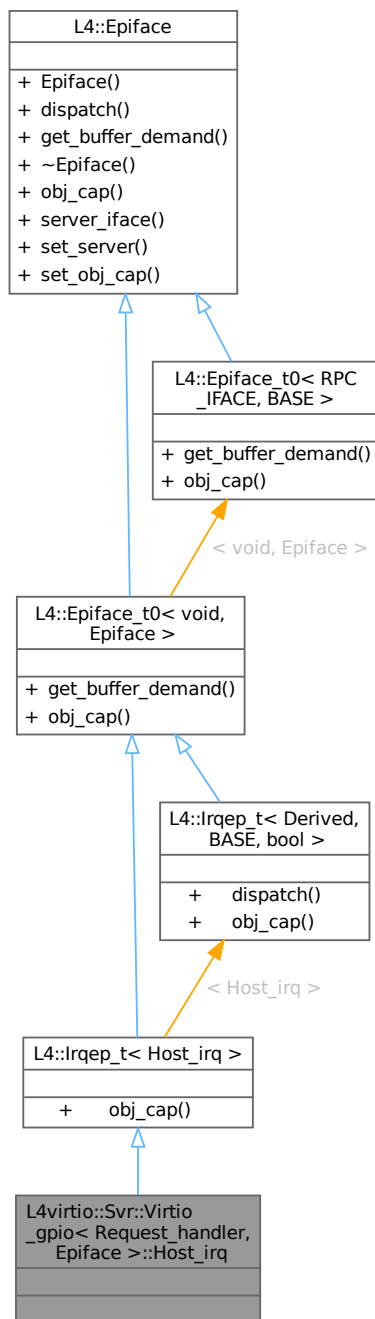

Handler for the host irq.

```
#include <virtio-gpio-device>
```

*Deprecated server registration function.*

### 16.410.1 Detailed Description

```
template<typename Request_handler, typename Epiface = L4virtio::Device>
struct L4virtio::Svr::Virtio_gpio< Request_handler, Epiface >::Host_irq
```

Handler for the host irq.

An [L4::lrqep\\_t](#) to handle irq's send to the server.

Definition at line 198 of file [virtio-gpio-device](#).

The documentation for this struct was generated from the following file:

- I4/I4virtio/server/virtio-gpio-device

## 16.411 L4virtio::Svr::Virtio\_gpio< Request\_handler, Epiface >::Irq\_handler Struct Reference

Handler for an gpio pin irq.

```
#include <virtio-gpio-device>
```

Collaboration diagram for L4virtio::Svr::Virtio\_gpio< Request\_handler, Epiface >::Irq\_handler:

### 16.411.1 Detailed Description

```
template<typename Request_handler, typename Epiface = L4virtio::Device>
struct L4virtio::Svr::Virtio_gpio< Request_handler, Epiface >::Irq_handler
```

Handler for an gpio pin irq.

This notifies the virtio client that an gpio pin irq happened or the operation was canceled.

This needs to be called by any server implementation of the [Virtio\\_gpio](#) class, after an irq was enabled with the enable method of the [Gpio\\_request\\_handler](#).

Definition at line 166 of file [virtio-gpio-device](#).

The documentation for this struct was generated from the following file:

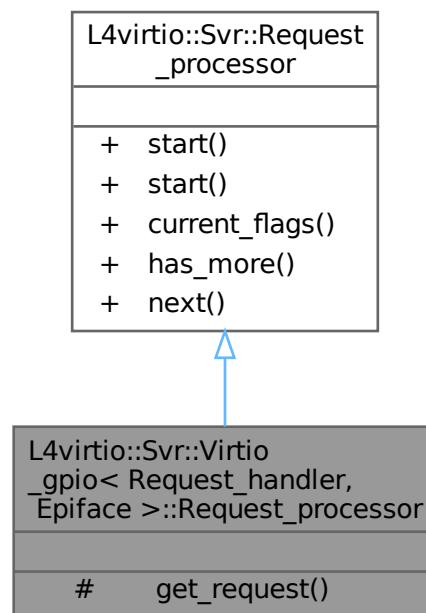

- I4/I4virtio/server/virtio-gpio-device

## 16.412 L4virtio::Svr::Virtio\_gpio< Request\_handler, Epiface >::Request\_processor Struct Reference

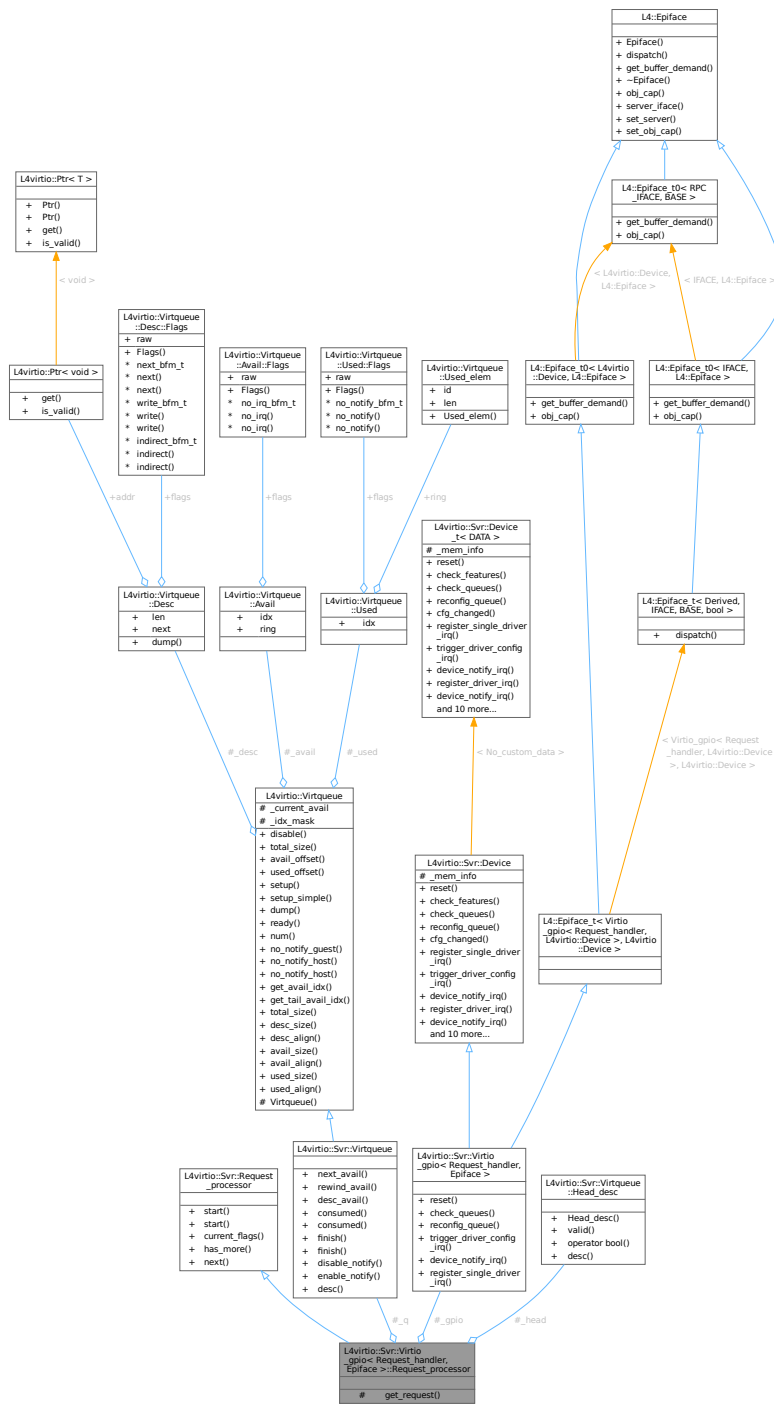

Generic handler for the Virtio requests.

```
#include <virtio-gpio-device>
```

Inheritance diagram for L4virtio::Svr::Virtio\_gpio< Request\_handler, Epiface >::Request\_processor:

Collaboration diagram for L4virtio::Svr::Virtio\_gpio< Request\_handler, Epiface >::Request\_processor:

## Protected Member Functions

- `template<typename T>`  
`T get_request ()`

The driver prepares the GPIO request in two data parts: 1st: in\_hdr 2nd: out\_hdr.

## Additional Inherited Members

### Public Member Functions inherited from [L4virtio::Svr::Request\\_processor](#)

- `template<typename DESC_MAN, typename ... ARGS>`  
`void start (DESC_MAN *dm, Virtqueue *ring, Virtqueue::Head\_desc const &request, ARGS... args)`  
*Start processing a new request.*
- `template<typename DESC_MAN, typename ... ARGS>`  
`Virtqueue::Request const & start (DESC_MAN *dm, Virtqueue::Request const &request, ARGS... args)`  
*Start processing a new request.*
- `Virtqueue::Desc::Flags current\_flags () const`  
*Get the flags of the currently processed descriptor.*
- `bool has\_more () const`  
*Are there more chained descriptors?*
- `template<typename DESC_MAN, typename ... ARGS>`  
`bool next (DESC_MAN *dm, ARGS... args)`  
*Switch to the next descriptor in a descriptor chain.*

## 16.412.1 Detailed Description

`template<typename Request_handler, typename Epiface = L4virtio::Device>`  
`struct L4virtio::Svr::Virtio\_gpio< Request\_handler, Epiface >::Request\_processor`

Generic handler for the Virtio requests.

Definition at line 213 of file [virtio-gpio-device](#).

## 16.412.2 Member Function Documentation

### 16.412.2.1 [get\\_request\(\)](#)

```
template<typename Request_handler, typename Epiface = L4virtio::Device>
template<typename T>
T L4virtio::Svr::Virtio\_gpio< Request\_handler, Epiface >::Request\_processor::get\_request ()
[inline], [protected]
```

The driver prepares the GPIO request in two data parts: 1st: in\_hdr 2rd: out\_hdr.

This parses the two Data\_buffers and create the Gpio\_\* structure.

Definition at line 241 of file [virtio-gpio-device](#).

References [L4virtio::Svr::Request\\_processor::current\\_flags\(\)](#), and [L4virtio::Svr::Request\\_processor::next\(\)](#).

Here is the call graph for this function:

The documentation for this struct was generated from the following file:

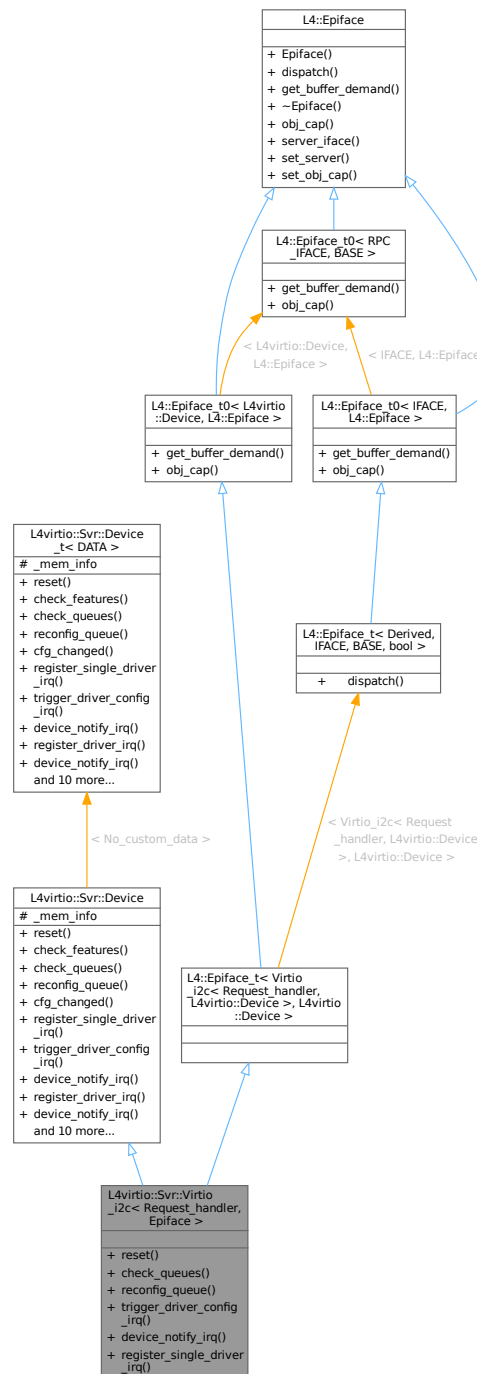

- `l4/l4virtio/server/virtio-gpio-device`

## 16.413 L4virtio::Svr::Virtio\_i2c< Request\_handler, Epiface > Class Template Reference

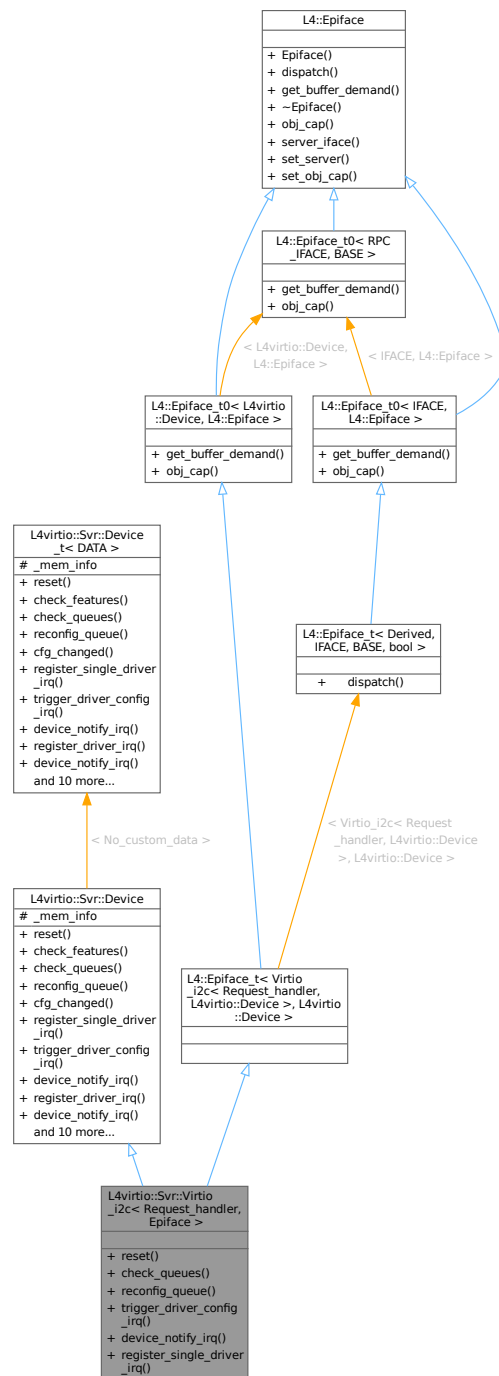

A server implementation of the virtio-i2c protocol.

```
#include <virtio-i2c-device>
```

Inheritance diagram for L4virtio::Svr::Virtio\_i2c< Request\_handler, Epiface >:

Collaboration diagram for L4virtio::Svr::Virtio\_i2c< Request\_handler, Epiface >:

## Data Structures

## 16.416.1 Detailed Description

```
template<typename Rnd_state, typename Epiface = L4virtio::Device>
class L4virtio::Svr::Virtio_rng< Rnd_state, Epiface >
```

A server implementation of the virtio-rng protocol.

## Template Parameters

---

<i>Rnd_state</i>	The type that implements the random data generation. <code>Rnd_state::get_random(int len, unsigned char *buf)</code> is called to get len random bytes written into buf TODO: virtio-rng supports providing less random bytes then requested. This API currently does not support that, as I do not have a test case.
<i>Epiface</i>	The Epiface to derive from. Defaults to <code>L4virtio::Device</code> .

Definition at line 33 of file [virtio-rng-device](#).

The documentation for this class was generated from the following file:

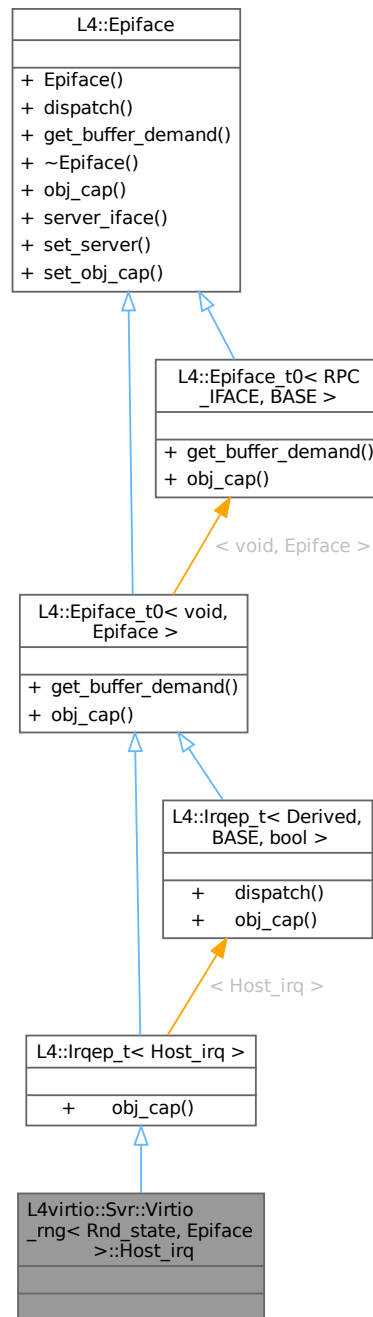

- `I4/I4virtio/server/virtio-rng-device`

## 16.419.1 Detailed Description

[Virtqueue](#) implementation for the device.

This class represents a single virtqueue, with a local running available index.

#### Note

The [Virtqueue](#) implementation is not thread-safe.

Definition at line 87 of file [virtio](#).

## 16.419.2 Member Function Documentation

### 16.419.2.1 consumed() [1/2]

```
void L4virtio::Svr::Virtqueue::consumed (
    Head_desc const & r,
    l4_uint32_t len = 0) [inline]
```

Put the given descriptor into the used ring.

#### Parameters

<i>r</i>	Request that shall be marked as finished.
<i>len</i>	The total number of bytes written.

#### Precondition

queue must be in working state.

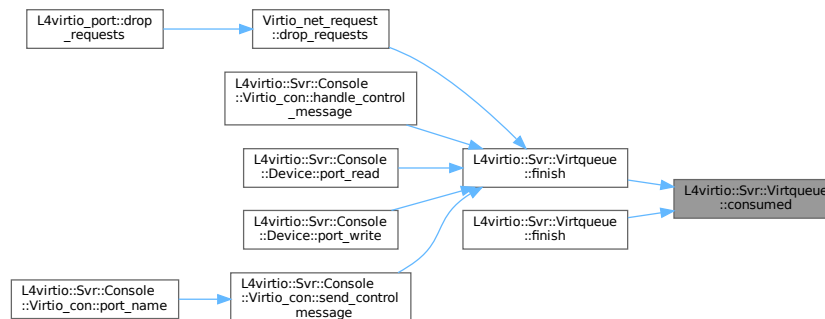

*r* must be a valid request from this queue.

Definition at line 190 of file [virtio](#).

References [L4virtio::Virtqueue::\\_desc](#), [L4virtio::Virtqueue::\\_idx\\_mask](#), and [L4virtio::Virtqueue::\\_used](#).

Referenced by [finish\(\)](#), and [finish\(\)](#).

Here is the caller graph for this function:

### 16.419.2.2 consumed() [2/2]

```
template<typename ITER>
void L4virtio::Svr::Virtqueue::consumed (
    ITER const & begin,
    ITER const & end) [inline]
```

Put multiple descriptors into the used ring.

A range of descriptors, specified by `begin` and `end` iterators is added. Each iterator points to a struct that has a first member that is a [Head\\_desc](#) and a second member that is the corresponding number of bytes written.

#### Template Parameters

<i>ITER</i>	The type of the iterator (inferred).
-------------	--------------------------------------

### Parameters

<i>begin</i>	Iterator pointing to first new descriptor.
<i>end</i>	Iterator pointing to one past last entry.

### Precondition

queue must be in working state.

Definition at line 213 of file [virtio](#).

References [L4virtio::Virtqueue::\\_desc](#), [L4virtio::Virtqueue::\\_idx\\_mask](#), and [L4virtio::Virtqueue::\\_used](#).

### 16.419.2.3 desc()

```
Desc const * L4virtio::Svr::Virtqueue::desc (
    unsigned idx) const [inline]
```

Get a descriptor from the descriptor list.

### Parameters

<i>idx</i>	The index of the descriptor.
------------	------------------------------

### Precondition

`idx < num`

queue must be in working state

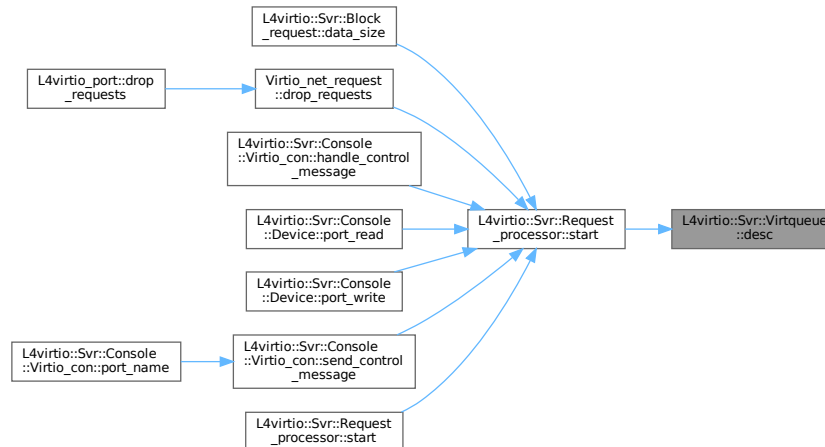

Definition at line 298 of file [virtio](#).

References [L4virtio::Virtqueue::\\_desc](#).

Referenced by [L4virtio::Svr::Request\\_processor::start\(\)](#).

Here is the caller graph for this function:

#### 16.419.2.4 desc\_avail()

```
bool L4virtio::Svr::Virtqueue::desc_avail () const [inline]
```

Test for available descriptors.

##### Returns

true if there are descriptors available, false if not.

##### Precondition

The queue must be in working state.

Definition at line 175 of file [virtio](#).

References [L4virtio::Virtqueue::\\_avail](#), and [L4virtio::Virtqueue::\\_current\\_avail](#).

Referenced by [Virtio\\_net\\_request::drop\\_requests\(\)](#), and [L4virtio\\_port::tx\\_work\\_pending\(\)](#).

Here is the caller graph for this function:

### 16.419.2.5 `disable_notify()`

```
void L4virtio::Svr::Virtqueue::disable_notify () [inline]
```

Set the 'no notify' flag for this queue.

This function may be called on a disabled queue.

Definition at line 273 of file [virtio](#).

References [L4virtio::Virtqueue::\\_used](#), [L4\\_LIKELY](#), and [L4virtio::Virtqueue::ready\(\)](#).

Referenced by [Virtio\\_switch::handle\\_l4virtio\\_port\\_tx\(\)](#).

Here is the call graph for this function:

Here is the caller graph for this function:

### 16.419.2.6 `enable_notify()`

```
void L4virtio::Svr::Virtqueue::enable_notify () [inline]
```

Clear the 'no notify' flag for this queue.

This function may be called on a disabled queue.

Definition at line 284 of file [virtio](#).

References [L4virtio::Virtqueue::\\_used](#), [L4\\_LIKELY](#), and [L4virtio::Virtqueue::ready\(\)](#).

Referenced by [Virtio\\_switch::handle\\_l4virtio\\_port\\_tx\(\)](#).

Here is the call graph for this function:

Here is the caller graph for this function:

### 16.419.2.7 finish() [1/2]

```

template<typename QUEUE_OBSERVER>
void L4virtio::Svr::Virtqueue::finish (
    Head_desc & d,
    QUEUE_OBSERVER * o,
    l4_uint32_t len = 0) [inline]
  
```

Add a descriptor to the used ring, and notify an observer.

#### Template Parameters

<code>QUEUE_OBSERVER</code>	The type of the observer (inferred).
-----------------------------	--------------------------------------

#### Parameters

<code>d</code>	descriptor of the request that is to be marked as finished.
<code>o</code>	Pointer to the observer that is notified.
<code>len</code>	Number of bytes written for this request.

**Precondition**

queue must be in working state.  
 d must be a valid request from this queue.

Definition at line 240 of file [virtio](#).

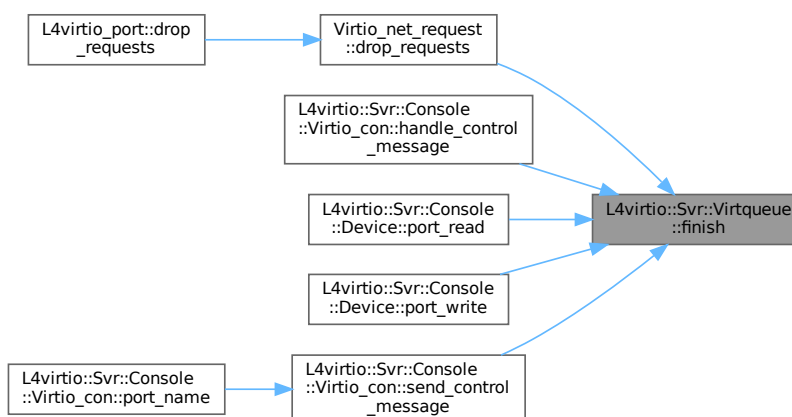

References [consumed\(\)](#).

Referenced by [Virtio\\_net\\_request::drop\\_requests\(\)](#), [L4virtio::Svr::Console::Virtio\\_con::handle\\_control\\_message\(\)](#), [L4virtio::Svr::Console::Device::port\\_read\(\)](#), [L4virtio::Svr::Console::Device::port\\_write\(\)](#), and [L4virtio::Svr::Console::Virtio\\_con::send\\_control\\_message\(\)](#).

Here is the call graph for this function:

Here is the caller graph for this function:

**16.419.2.8 finish() [2/2]**

```

template<typename ITER, typename QUEUE_OBSERVER>
void L4virtio::Svr::Virtqueue::finish (
    ITER const & begin,
    ITER const & end,
    QUEUE_OBSERVER * o) [inline]
  
```

Add a range of descriptors to the used ring, and notify an observer once.

The iterators are passed to [consumed<ITER>\(ITER const &, ITER const &\)](#), and the requirements detailed there apply.

**Template Parameters**

<i>ITER</i>	type of the iterator (inferred)
<i>QUEUE_OBSERVER</i>	the type of the observer (inferred).

### Parameters

<i>begin</i>	iterator pointing to first element.
<i>end</i>	iterator pointing to one past last element.
<i>o</i>	pointer to the observer that is notified.

### Precondition

queue must be in working state.

Definition at line 262 of file [virtio](#).

References [consumed\(\)](#).

Here is the call graph for this function:

### 16.419.2.9 next\_avail()

```
Request L4virtio::Svr::Virtqueue::next_avail () [inline]
```

Get the next available descriptor from the available ring.

### Precondition

The queue must be in working state.

### Returns

A Request for the next available descriptor, the Request is invalid if there are no descriptors in the available ring.

**Note**

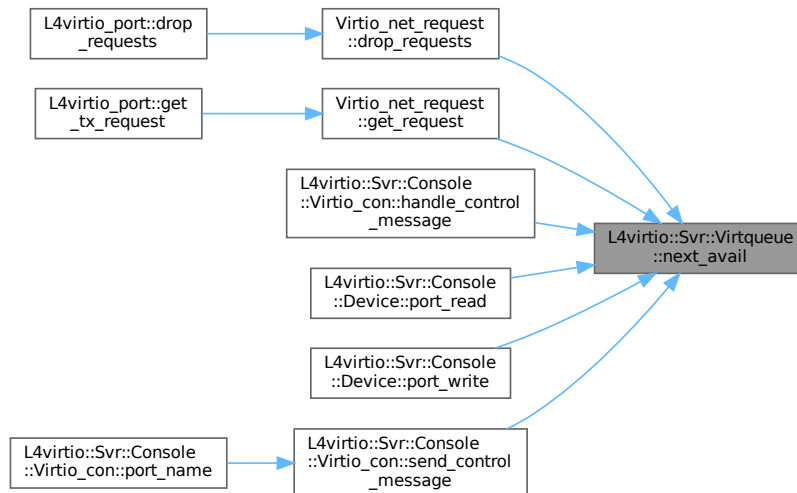

The return value must be checked even when a previous `desc_avail()` returned true.

Definition at line 136 of file `virtio`.

References `L4virtio::Virtqueue::_avail`, `L4virtio::Virtqueue::_current_avail`, `L4virtio::Virtqueue::_idx_mask`, and `L4_LIKELY`.

Referenced by `Virtio_net_request::drop_requests()`, `Virtio_net_request::get_request()`, `L4virtio::Svr::Console::Virtio_con::handle_control_message()`, `L4virtio::Svr::Console::Device::port_read()`, `L4virtio::Svr::Console::Device::port_write()`, and `L4virtio::Svr::Console::Virtio_con::send_control_message()`.

Here is the caller graph for this function:

**16.419.2.10 rewind\_avail()**

```
void L4virtio::Svr::Virtqueue::rewind_avail (
    Head_desc const & d) [inline]
```

Return unfinished descriptors to the available ring, i.e.

reset the local next index of the available ring to the given descriptor.

**Parameters**

<i>d</i>	descriptor of the request that is to be marked as finished.
----------	---

**Precondition**

queue must be in working state.

*d* must be a valid request from this queue, obtained via `next_avail()`, that has not yet been finished, and in addition, no descriptors following it have been finished.

Definition at line 160 of file `virtio`.

References `L4virtio::Virtqueue::_current_avail`, `L4virtio::Virtqueue::_desc`, and `L4virtio::Virtqueue::_idx_mask`.

*The life counter for the queue.*
- **l4\_uint16\_t** **\_idx\_mask** = 0  
*mask used for indexing into the descriptor table and the rings.*

## 16.421.1 Detailed Description

Low-level [Virtqueue](#).

This class represents a single virtqueue, with a local running available index.

### Note

The [Virtqueue](#) implementation is not thread-safe.

Definition at line 80 of file [virtqueue](#).

## 16.421.2 Member Function Documentation

### 16.421.2.1 avail\_align()

```
unsigned long L4virtio::Virtqueue::avail_align () [inline], [static]
```

Get the alignment in zero LSBs needed for the available ring.

### Returns

The alignment in zero LSBs needed for an available ring.

Definition at line 287 of file [virtqueue](#).

### 16.421.2.2 avail\_size()

```
unsigned long L4virtio::Virtqueue::avail_size (
    unsigned num) [inline], [static]
```

Calculate the size of the available ring for [num](#) entries.

### Parameters

---

<i>num</i>	The number of entries in the available ring.
------------	--

### Returns

The size in bytes needed for an available ring with *num* entries.

Definition at line 279 of file [virtqueue](#).

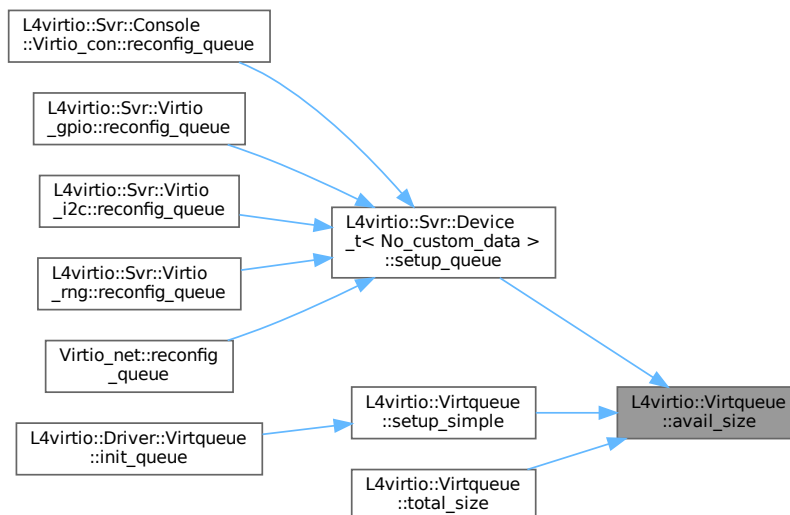

References [num\(\)](#).

Referenced by [L4virtio::Svr::Device\\_t< No\\_custom\\_data >::setup\\_queue\(\)](#), [setup\\_simple\(\)](#), and [total\\_size\(\)](#).

Here is the call graph for this function:

Here is the caller graph for this function:

### 16.421.2.3 desc\_align()

```
unsigned long L4virtio::Virtqueue::desc_align () [inline], [static]
```

Get the alignment in zero LSBs needed for the descriptor table.

#### Returns

The alignment in zero LSBs needed for a descriptor table.

Definition at line 269 of file [virtqueue](#).

### 16.421.2.4 desc\_size()

```
unsigned long L4virtio::Virtqueue::desc_size (  
    unsigned num) [inline], [static]
```

Calculate the size of the descriptor table for [num](#) entries.

#### Parameters

<i>num</i>	The number of entries in the descriptor table.
------------	--

#### Returns

The size in bytes needed for a descriptor table with [num](#) entries.

Definition at line 261 of file [virtqueue](#).

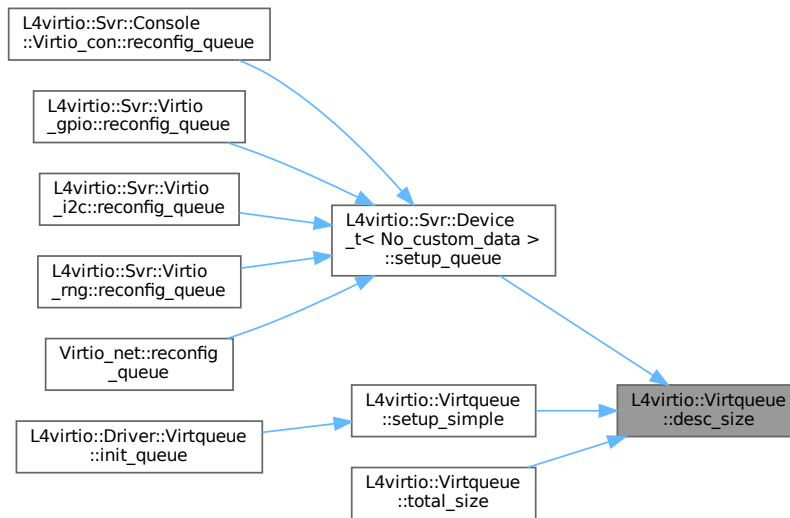

References [num\(\)](#).

Referenced by [L4virtio::Svr::Device\\_t< No\\_custom\\_data >::setup\\_queue\(\)](#), [setup\\_simple\(\)](#), and [total\\_size\(\)](#).

Here is the call graph for this function:

Here is the caller graph for this function:

#### 16.421.2.5 disable()

```
void L4virtio::Virtqueue::disable () [inline]
```

Completely disable the queue.

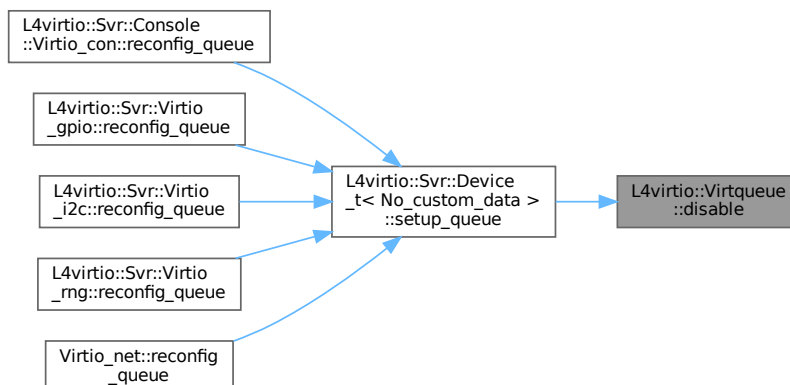

[setup\(\)](#) must be used to enable the queue again.

Definition at line 224 of file [virtqueue](#).

References [\\_desc](#).

Referenced by [L4virtio::Svr::Device\\_t< No\\_custom\\_data >::setup\\_queue\(\)](#).

Here is the caller graph for this function:

### 16.421.2.6 dump()

```
void L4virtio::Virtqueue::dump (
    Desc const * d) const [inline]
```

Dump descriptors for this queue.

#### Precondition

the queue must be in working state.

Definition at line 392 of file [virtqueue](#).

References [\\_desc](#), and [L4virtio::Virtqueue::Desc::dump\(\)](#).

Here is the call graph for this function:

### 16.421.2.7 get\_avail\_idx()

```
l4_uint16_t L4virtio::Virtqueue::get_avail_idx () const [inline]
```

Get available index from available ring (for debugging).

#### Precondition

Queue must be in a working state.

#### Returns

current index in the available ring (shared between device model and device driver).

Definition at line 449 of file [virtqueue](#).

References [\\_avail](#).

**16.421.2.8 get\_tail\_avail\_idx()**

```
l4_uint16_t L4virtio::Virtqueue::get_tail_avail_idx () const [inline]
```

Get tail-available index stored in local state (for debugging).

**Returns**

current tail index for the the available ring.

Definition at line 456 of file [virtqueue](#).

References [\\_current\\_avail](#).

**16.421.2.9 no\_notify\_guest()**

```
bool L4virtio::Virtqueue::no_notify_guest () const [inline]
```

Get the no IRQ flag of this queue.

**Precondition**

queue must be in working state.

**Returns**

true if the guest does not want to get IRQs (currently).

Definition at line 414 of file [virtqueue](#).

References [\\_avail](#).

Referenced by [L4virtio::Svr::Block\\_dev\\_base<Ds\\_data>::finalize\\_request\(\)](#), and [L4virtio::Svr::Console::Device::notify\\_queue\(\)](#).

Here is the caller graph for this function:

**16.421.2.10 no\_notify\_host() [1/2]**

```
bool L4virtio::Virtqueue::no_notify_host () const [inline]
```

Get the no notify flag of this queue.

**Precondition**

queue must be in working state.

**Returns**

true if the host does not want to get IRQs (currently).

Definition at line 426 of file [virtqueue](#).

References [\\_used](#).

**16.421.2.11 no\_notify\_host() [2/2]**

```
void L4virtio::Virtqueue::no_notify_host (  
    bool value) [inline]
```

Set the no-notify flag for this queue.

**Precondition**

Queue must be in a working state.

Definition at line 436 of file [virtqueue](#).

References [\\_used](#).

**16.421.2.12 num()**

```
unsigned L4virtio::Virtqueue::num () const [inline]
```

## Returns

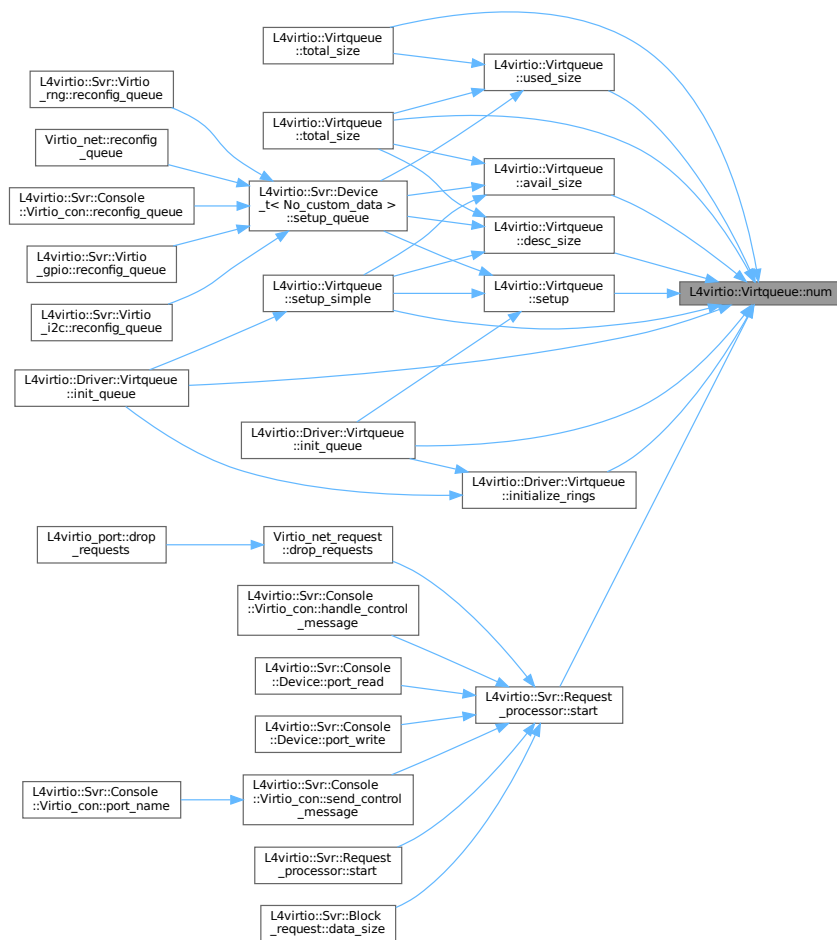

The number of entries in the ring.

Definition at line 404 of file [virtqueue](#).

References [\\_idx\\_mask](#).

Referenced by [avail\\_size\(\)](#), [desc\\_size\(\)](#), [L4virtio::Driver::Virtqueue::init\\_queue\(\)](#), [L4virtio::Driver::Virtqueue::init\\_queue\(\)](#), [L4virtio::Driver::Virtqueue::initialize\\_rings\(\)](#), [setup\(\)](#), [setup\\_simple\(\)](#), [L4virtio::Svr::Request\\_processor::start\(\)](#), [total\\_size\(\)](#), [total\\_size\(\)](#), and [used\\_size\(\)](#).

Here is the caller graph for this function:

### 16.421.2.13 ready()

```
bool L4virtio::Virtqueue::ready () const [inline]
```

Test if this queue is in working state.

**Returns**

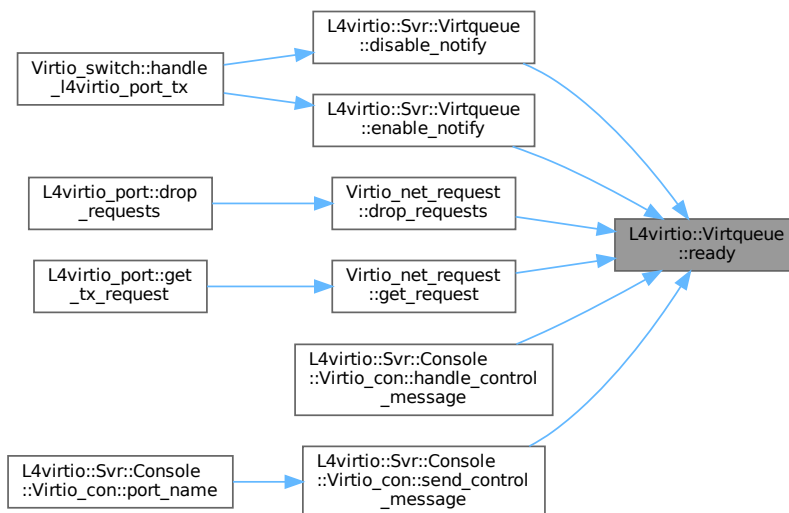

true when the queue is in working state, false else.

Definition at line 400 of file [virtqueue](#).

References [\\_desc](#), and [L4\\_LIKELY](#).

Referenced by [L4virtio::Svr::Virtqueue::disable\\_notify\(\)](#), [Virtio\\_net\\_request::drop\\_requests\(\)](#), [L4virtio::Svr::Virtqueue::enable\\_notify\(\)](#), [Virtio\\_net\\_request::get\\_request\(\)](#), [L4virtio::Svr::Console::Virtio\\_con::handle\\_control\\_message\(\)](#), and [L4virtio::Svr::Console::Virtio\\_con::port\\_name\(\)](#).

Here is the caller graph for this function:

**16.421.2.14 setup()**

```

void L4virtio::Virtqueue::setup (
    unsigned num,
    void * desc,
    void * avail,
    void * used) [inline]

```

Enable this queue.

**Parameters**

<i>num</i>	The number of entries in the descriptor table, the available ring, and the used ring (must be a power of 2).
<i>desc</i>	The address of the descriptor table. (Must be Desc_align aligned and at least desc_size(num) bytes in size.)
<i>avail</i>	The address of the available ring. (Must be Avail_align aligned and at least avail_size(num) bytes in size.)

<i>used</i>	The address of the used ring. (Must be <code>Used_align</code> aligned and at least <code>used_size(num)</code> bytes in size.)
-------------	---

Due to the data type of the descriptors, the queue can have a maximum size of  $2^{16}$ .

Definition at line 349 of file [virtqueue](#).

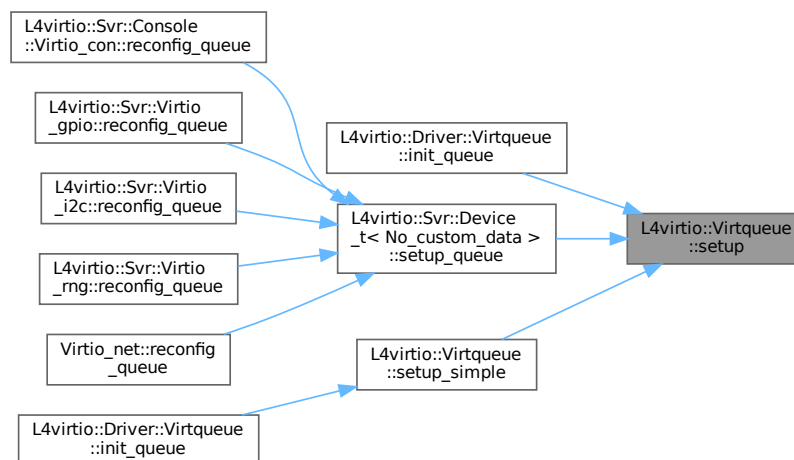

References [\\_avail](#), [\\_current\\_avail](#), [\\_desc](#), [\\_idx\\_mask](#), [\\_used](#), [L4\\_EINVAL](#), and [num\(\)](#).

Referenced by [L4virtio::Driver::Virtqueue::init\\_queue\(\)](#), [L4virtio::Svr::Device\\_t< No\\_custom\\_data >::setup\\_queue\(\)](#), and [setup\\_simple\(\)](#).

Here is the call graph for this function:

Here is the caller graph for this function:

### 16.421.2.15 setup\_simple()

```
void L4virtio::Virtqueue::setup_simple (
    unsigned num,
    void * ring) [inline]
```

Enable this queue.

#### Parameters

<i>num</i>	The number of entries in the descriptor table, the available ring, and the used ring (must be a power of 2).
<i>ring</i>	The base address for the queue data structure. The memory block at <code>ring</code> must be at least <code>total_size(num)</code> bytes in size and have an alignment of <code>Desc_align(desc_align())</code> bits.

Due to the data type of the descriptors, the queue can have a maximum size of  $2^{16}$ .

Definition at line 378 of file [virtqueue](#).

References [avail\\_size\(\)](#), [desc\\_size\(\)](#), [l4\\_round\\_size\(\)](#), [num\(\)](#), and [setup\(\)](#).

Referenced by [L4virtio::Driver::Virtqueue::init\\_queue\(\)](#).

Here is the call graph for this function:

Here is the caller graph for this function:

### 16.421.2.16 total\_size() [1/2]

```
unsigned long L4virtio::Virtqueue::total_size () const [inline]
```

Calculate the total size of this virtqueue.

**Precondition**

The queue has been set up.

Definition at line 314 of file [virtqueue](#).

References [\\_desc](#), [\\_used](#), [num\(\)](#), and [used\\_size\(\)](#).

Here is the call graph for this function:

**16.421.2.17 total\_size() [2/2]**

```

unsigned long L4virtio::Virtqueue::total_size (
    unsigned num) [inline], [static]
  
```

Calculate the total size for a virtqueue of the given dimensions.

**Parameters**

<i>num</i>	The number of entries in the descriptor table, the available ring, and the used ring (must be a power of 2).
------------	--

**Returns**

The total size in bytes of the queue data structures.

Definition at line 245 of file [virtqueue](#).

References [avail\\_size\(\)](#), [desc\\_size\(\)](#), [l4\\_round\\_size\(\)](#), [num\(\)](#), and [used\\_size\(\)](#).

Here is the call graph for this function:

### 16.421.2.18 used\_align()

```
unsigned long L4virtio::Virtqueue::used_align () [inline], [static]
```

Get the alignment in zero LSBs needed for the used ring.

#### Returns

The alignment in zero LSBs needed for an used ring.

Definition at line 306 of file [virtqueue](#).

### 16.421.2.19 used\_size()

```
unsigned long L4virtio::Virtqueue::used_size (  
    unsigned num) [inline], [static]
```

Calculate the size of the used ring for [num](#) entries.

#### Parameters

<i>num</i>	The number of entries in the used ring.
------------	---

#### Returns

The size in bytes needed for an used ring with [num](#) entries.

Definition at line 298 of file [virtqueue](#).

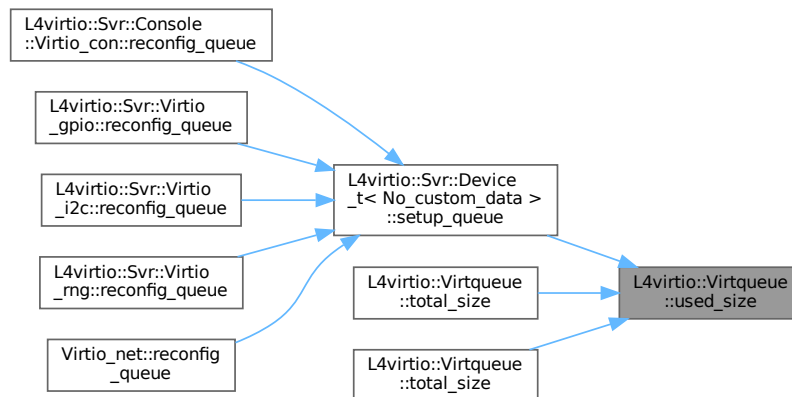

References [num\(\)](#).

Referenced by [L4virtio::Svr::Device\\_t< No\\_custom\\_data >::setup\\_queue\(\)](#), [total\\_size\(\)](#), and [total\\_size\(\)](#).

## 16.422 L4virtio::Virtqueue::Avail Class Reference

Type of available ring, this is read-only for the host.

```
#include <virtqueue>
```

Collaboration diagram for L4virtio::Virtqueue::Avail:

## Data Structures

- struct [Flags](#)  
*Flags of the available ring.*

## Data Fields

- [Flags](#) **flags**  
*flags of available ring*
- [l4\\_uint16\\_t](#) **idx**  
*available index written by guest*
- [l4\\_uint16\\_t](#) **ring** []  
*array of available descriptor indexes.*

## 16.422.1 Detailed Description

Type of available ring, this is read-only for the host.

Definition at line 128 of file [virtqueue](#).

The documentation for this class was generated from the following file:

- [l4/l4virtio/virtqueue](#)

## 16.423 L4virtio::Virtqueue::Avail::Flags Struct Reference

[Flags](#) of the available ring.

```
#include <virtqueue>
```

Collaboration diagram for L4virtio::Virtqueue::Avail::Flags:

L4virtio::Virtqueue ::Avail::Flags	
+	raw
+	Flags()
*	no_irq_bfm_t
*	no_irq()
*	no_irq()

### Public Member Functions

- **Flags** ([l4\\_uint16\\_t](#) v)  
*Make [Flags](#) from the raw value.*

### Data Fields

- [l4\\_uint16\\_t](#) raw  
*raw 16bit flags value of the available ring.*
- typedef [cxx::Bitfield](#)< decltype(raw), 0, 0 > [no\\_irq\\_bfm\\_t](#)  
*Guest does not want to receive interrupts when requests are finished.*

* write()
* write()
* indirect_bfm_t
* indirect()
* indirect()

## Public Member Functions

- **Flags** ([l4\\_uint16\\_t](#) v)  
Make *Flags* from raw 16bit value.

## Data Fields

- [l4\\_uint16\\_t](#) **raw**  
raw flags value of a virtio descriptor.
- typedef [cxx::Bitfield](#)< decltype([raw](#)), 0, 0 > [next\\_bfm\\_t](#)  
Part of a descriptor chain which is continued with the next field.
- constexpr [next\\_bfm\\_t::Val](#) **next** () const  
Get the *next* bits (0 to 0) of *raw*.
- constexpr [next\\_bfm\\_t::Ref](#) **next** ()  
Get a reference to the *next* bits (0 to 0) of *raw*.
- typedef [cxx::Bitfield](#)< decltype([raw](#)), 1, 1 > [write\\_bfm\\_t](#)  
Block described by this descriptor is writeable.
- constexpr [write\\_bfm\\_t::Val](#) **write** () const  
Get the *write* bits (1 to 1) of *raw*.
- constexpr [write\\_bfm\\_t::Ref](#) **write** ()  
Get a reference to the *write* bits (1 to 1) of *raw*.
- typedef [cxx::Bitfield](#)< decltype([raw](#)), 2, 2 > [indirect\\_bfm\\_t](#)  
Indirect descriptor, block contains a list of descriptors.
- constexpr [indirect\\_bfm\\_t::Val](#) **indirect** () const  
Get the *indirect* bits (2 to 2) of *raw*.
- constexpr [indirect\\_bfm\\_t::Ref](#) **indirect** ()  
Get a reference to the *indirect* bits (2 to 2) of *raw*.

### 16.425.1 Detailed Description

Type for descriptor flags.

Definition at line 92 of file [virtqueue](#).

### 16.425.2 Member Typedef Documentation

#### 16.425.2.1 indirect\_bfm\_t

```
typedef cxx::Bitfield<decltype(raw), 2, 2> L4virtio::Virtqueue::Desc::Flags::indirect\_bfm\_t
```

Indirect descriptor, block contains a list of descriptors.

Type to access the *indirect* bits (2 to 2) of *raw*.

Definition at line 105 of file [virtqueue](#).

## 16.425.2.2 next\_bfm\_t

```
typedef cxx::Bitfield<decltype(raw), 0, 0> L4virtio::Virtqueue::Desc::Flags::next_bfm_t
```

Part of a descriptor chain which is continued with the next field.

Type to access the `next` bits (0 to 0) of `raw`.

Definition at line 101 of file `virtqueue`.

## 16.425.2.3 write\_bfm\_t

```
typedef cxx::Bitfield<decltype(raw), 1, 1> L4virtio::Virtqueue::Desc::Flags::write_bfm_t
```

Block described by this descriptor is writeable.

Type to access the `write` bits (1 to 1) of `raw`.

Definition at line 103 of file `virtqueue`.

The documentation for this struct was generated from the following file:

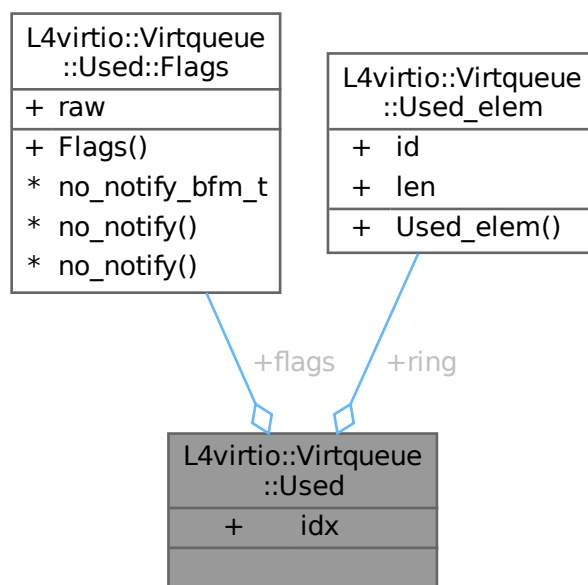

- `l4/l4virtio/virtqueue`

## 16.426 L4virtio::Virtqueue::Used Class Reference

`Used` ring.

```
#include <virtqueue>
```

Collaboration diagram for L4virtio::Virtqueue::Used:

## Data Structures

- struct [Flags](#)  
*flags for the used ring.*

## Data Fields

- [Flags](#) **flags**  
*flags of the used ring.*
- [l4\\_uint16\\_t](#) **idx**  
*index of the last entry in the ring.*
- [Used\\_elem](#) **ring** []  
*array of used descriptors.*

### 16.426.1 Detailed Description

[Used](#) ring.

Definition at line [173](#) of file [virtqueue](#).

The documentation for this class was generated from the following file:

- [l4/l4virtio/virtqueue](#)

### 16.427 L4virtio::Virtqueue::Used::Flags Struct Reference

flags for the used ring.

```
#include <virtqueue>
```

*Get a reference to the [no\\_notify](#) bits (0 to 0) of [raw](#).*

### 16.427.1 Detailed Description

flags for the used ring.

Definition at line 179 of file [virtqueue](#).

### 16.427.2 Member Typedef Documentation

#### 16.427.2.1 no\_notify\_bfm\_t

```
typedef cxx::Bitfield<decltype(raw), 0, 0> L4virtio::Virtqueue::Used::Flags::no\_notify\_bfm\_t
```

host does not want to be notified when new requests have been queued.

Type to access the [no\\_notify](#) bits (0 to 0) of [raw](#).

Definition at line 188 of file [virtqueue](#).

The documentation for this struct was generated from the following file:

- [l4/l4virtio/virtqueue](#)

## 16.428 L4virtio::Virtqueue::Used\_elem Struct Reference

Type of an element of the used ring.

```
#include <virtqueue>
```

Collaboration diagram for L4virtio::Virtqueue::Used\_elem:

L4virtio::Virtqueue ::Used_elem
+ id
+ len
+ Used_elem()

### Public Member Functions

- [Used\\_elem](#) ([l4\\_uint16\\_t id](#), [l4\\_uint32\\_t len](#))  
*Initialize a used ring element.*

### Data Fields

- [l4\\_uint32\\_t id](#)  
*descriptor index*
- [l4\\_uint32\\_t len](#)  
*length field*

### 16.428.1 Detailed Description

Type of an element of the used ring.

Definition at line [154](#) of file [virtqueue](#).

### 16.428.2 Constructor & Destructor Documentation

#### 16.428.2.1 Used\_elem()

```
L4virtio::Virtqueue::Used_elem::Used_elem (
    l4_uint16_t id,
    l4_uint32_t len) [inline]
```

Initialize a used ring element.

#### Parameters

---

<i>id</i>	The index of the descriptor to be marked as used.
<i>len</i>	The total bytes written into the buffer of the descriptor chain.

Definition at line 165 of file [virtqueue](#).

References [id](#), and [len](#).

The documentation for this struct was generated from the following file:

- l4/l4virtio/virtqueue

## 16.429 l4virtio\_block\_config\_t Struct Reference

Device configuration for block devices.

```
#include <virtio_block.h>
```

Collaboration diagram for l4virtio\_block\_config\_t:

l4virtio_block_config_t	
+	capacity
+	size_max
+	seg_max
+	blk_size

### Data Fields

- [l4\\_uint64\\_t](#) **capacity**  
*Capacity of device in 512-byte sectors.*
- [l4\\_uint32\\_t](#) **size\_max**  
*Maximum size of a single segment.*
- [l4\\_uint32\\_t](#) **seg\_max**  
*Maximum number of segments per request.*
- [l4\\_uint32\\_t](#) **blk\_size**  
*Block size of underlying disk.*

### 16.429.1 Detailed Description

Device configuration for block devices.

Definition at line 68 of file [virtio\\_block.h](#).

The documentation for this struct was generated from the following file:

- l4/l4virtio/virtio\_block.h

## 16.430 l4virtio\_block\_discard\_t Struct Reference

Structure used for the write zeroes and discard commands.

```
#include <virtio_block.h>
```

Collaboration diagram for l4virtio\_block\_discard\_t:

### 16.430.1 Detailed Description

Structure used for the write zeroes and discard commands.

Definition at line 58 of file [virtio\\_block.h](#).

The documentation for this struct was generated from the following file:

- l4/l4virtio/virtio\_block.h

## 16.431 l4virtio\_block\_header\_t Struct Reference

Header structure of a request for a block device.

```
#include <virtio_block.h>
```

Collaboration diagram for l4virtio\_block\_header\_t:

l4virtio_block_header_t	
+	type
+	ioprio
+	sector

### Data Fields

- [l4\\_uint32\\_t](#) **type**  
*Kind of request, see [L4virtio\\_block\\_operations](#).*
- [l4\\_uint32\\_t](#) **ioprio**  
*Priority (unused).*
- [l4\\_uint64\\_t](#) **sector**  
*First sector to read/write.*

### 16.431.1 Detailed Description

Header structure of a request for a block device.

Definition at line 42 of file [virtio\\_block.h](#).

The documentation for this struct was generated from the following file:

- l4/l4virtio/virtio\_block.h

## 16.432 l4virtio\_config\_hdr\_t Struct Reference

L4-VIRTIO config header, provided in shared data space.

```
#include <virtio.h>
```

Collaboration diagram for l4virtio\_config\_hdr\_t:

l4virtio_config_hdr_t
+ magic
+ version
+ device
+ vendor
+ dev_features
+ num_queues
+ queues_offset

### Data Fields

- [l4\\_uint32\\_t](#) **magic**  
*magic value (must be 'virt').*
- [l4\\_uint32\\_t](#) **version**  
*VIRTIO version.*
- [l4\\_uint32\\_t](#) **device**  
*device ID*
- [l4\\_uint32\\_t](#) **vendor**  
*vendor ID*
- [l4\\_uint32\\_t](#) **dev\_features**  
*device features windows selected by device\_feature\_sel*
- [l4\\_uint32\\_t](#) **num\_queues**  
*number of virtqueues*
- [l4\\_uint32\\_t](#) **queues\_offset**  
*offset of virtqueue config array*

### 16.432.1 Detailed Description

L4-VIRTIO config header, provided in shared data space.

Definition at line 132 of file [virtio.h](#).

## 16.433 l4virtio\_config\_queue\_t Struct Reference

Queue configuration entry.

```
#include <virtio.h>
```

Collaboration diagram for l4virtio\_config\_queue\_t:

l4virtio_config_queue_t
+ num_max
+ num
+ ready
+ driver_notify_index
+ desc_addr
+ avail_addr
+ used_addr
+ device_notify_index

### Data Fields

- [l4\\_uint16\\_t](#) **num\_max**  
*R: maximum number of descriptors supported by this queue.*
- [l4\\_uint16\\_t](#) **num**  
*RW: number of descriptors configured for this queue.*
- [l4\\_uint16\\_t](#) **ready**  
*RW: queue ready flag (read-write).*
- [l4\\_uint16\\_t](#) **driver\_notify\_index**  
*W: Event index to be used for device notifications (device to driver).*
- [l4\\_uint64\\_t](#) **desc\_addr**  
*W: address of descriptor table.*
- [l4\\_uint64\\_t](#) **avail\_addr**  
*W: address of available ring.*
- [l4\\_uint64\\_t](#) **used\_addr**  
*W: address of used ring.*
- [l4\\_uint16\\_t](#) **device\_notify\_index**  
*R: Event index to be used by the driver (driver to device).*

### 16.433.1 Detailed Description

Queue configuration entry.

An array of such entries is available at the [l4virtio\\_config\\_hdr\\_t::queues\\_offset](#) in the config data space.

Consistency rules for the queue config are:

- A driver might read [num\\_max](#) at any time.
- A driver must write to [num](#), [desc\\_addr](#), [avail\\_addr](#), and [used\\_addr](#) only when [ready](#) is zero (0). Values in these fields are validated and used by the device only after successfully setting [ready](#) to one (1), either by the IPC or by `L4VIRTIO_CMD_CFG_QUEUE`.
- The value of [device\\_notify\\_index](#) is valid only when [ready](#) is one.
- The driver might write to [device\\_notify\\_index](#) at any time, however the change is guaranteed to take effect after a successful `L4VIRTIO_CMD_CFG_QUEUE` or after a `config_queue` IPC. Note, the change might also have immediate effect, depending on the device implementation.

### 16.440.1 Detailed Description

A Port on the Virtio Net Switch.

A Port object gets created by `Virtio_factory::op_create()`. This function actually only instantiates objects of the types `Switch_port` and `Monitor_port`. The created Port registers itself at the switch's server. Usually, the IPC call for port creation comes from `ned`. To finalize the setup, the client has to initialize the port during the virtio initialization phase. To do this, the client registers a dataspace for queues and buffers and provides an IRQ to notify the client on incoming network requests.

Definition at line 36 of file [port\\_l4virtio.h](#).

### 16.440.2 Member Function Documentation

#### 16.440.2.1 drop\_requests()

```
void L4virtio_port::drop_requests () [inline]
```

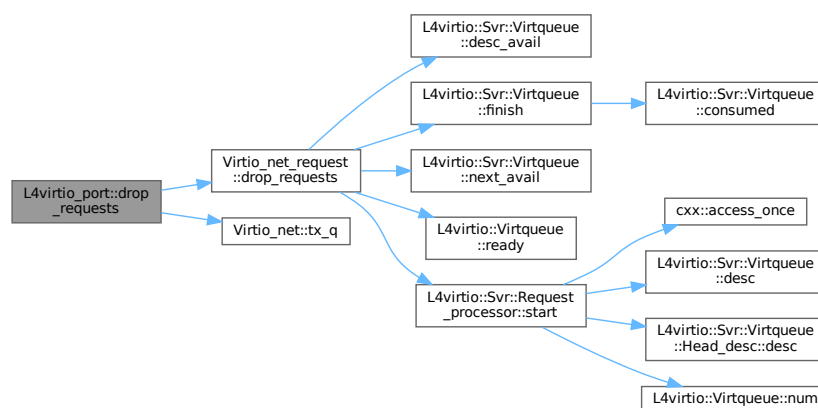

Drop all requests pending in the transmission queue.

This is used for monitor ports, which are not allowed to send packets.

Definition at line 103 of file [port\\_l4virtio.h](#).

References [Virtio\\_net\\_request::drop\\_requests\(\)](#), and [Virtio\\_net::tx\\_q\(\)](#).

Here is the call graph for this function:

The documentation for this class was generated from the following file:

- `pkg/virtio-net-switch/server/switch/port_l4virtio.h`

## 16.441 Mac\_addr Class Reference

A wrapper class around the value of a MAC address.

```
#include <mac_addr.h>
```

Collaboration diagram for Mac\_addr:

### Public Member Functions

- bool **is\_broadcast** () const  
*Check if MAC address is a broadcast or multicast address.*
- bool **is\_unknown** () const  
*Check if the MAC address is not yet known.*

### 16.441.1 Detailed Description

A wrapper class around the value of a MAC address.

Definition at line 19 of file [mac\\_addr.h](#).

The documentation for this class was generated from the following file:

- `pkg/virtio-net-switch/server/switch/mac_addr.h`

## 16.442 Mac\_table< Size > Class Template Reference

[Mac\\_table](#) manages a 1:n association between ports and MAC addresses.

```
#include <mac_table.h>
```

Collaboration diagram for `Mac_table< Size >`:

### Public Member Functions

- `Port_iface * lookup (Mac_addr dst, l4_uint16_t vlan_id) const`  
Find the destination port for a MAC address and VLAN id.
- `void learn (Mac_addr src, Port_iface *port, l4_uint16_t vlan_id)`  
Learn a MAC address (add it to the MAC table).
- `void flush (Port_iface *port)`  
Flush all associations with a given port.

## 16.442.1 Detailed Description

```
template<std::size_t Size = 1024U>
class Mac_table< Size >
```

`Mac_table` manages a 1:n association between ports and MAC addresses.

There are different types of devices which might be attached to a port. For a normal device the switch sees exactly one MAC address per port - the MAC address of the device attached to it. But there might be other devices like software bridges attached to the port sending packets with different MAC addresses to the port. Therefore the switch has to manage a 1:n association between ports and MAC addresses. The MAC table manages this association.

When a packet comes in we need to find the destination port for the packet and therefore perform a lookup based on the MAC address.

To prevent unbounded growth of the lookup table, the number of entries is limited. Replacement is done on a round-robin basis. If the capacity was reached, the oldest entry is evicted.

Definition at line 40 of file [mac\\_table.h](#).

## 16.442.2 Member Function Documentation

### 16.442.2.1 flush()

```
template<std::size_t Size = 1024U>
void Mac_table< Size >::flush (
    Port_iface * port) [inline]
```

Flush all associations with a given port.

#### Parameters

---

<i>port</i>	Pointer to port that is to be flushed
-------------	---------------------------------------

This function removes all references to a given port from the MAC table. Since we manage a 1:n association between ports and MAC addresses there might be more than one entry for a given port and we have to iterate over the whole array to delete every reference to the port.

Definition at line 129 of file [mac\\_table.h](#).

### 16.442.2.2 learn()

```
template<std::size_t Size = 1024U>
void Mac_table< Size >::learn (
    Mac_addr src,
    Port_iface * port,
    14_uint16_t vlan_id) [inline]
```

Learn a MAC address (add it to the MAC table).

#### Parameters

<i>src</i>	MAC address
<i>port</i>	Pointer to the port object that can be used to reach MAC address <i>src</i>
<i>vlan_id</i>	VLAN id of the packet destination.

Will evict the oldest learned address from the table if the maximum capacity was reached and if the MAC address was not known yet. The source port of the table entry is always updated to cope with clients that move between ports.

Definition at line 78 of file [mac\\_table.h](#).

References [L4\\_UNLIKELY](#), and [lookup\(\)](#).

Here is the call graph for this function:

### 16.442.2.3 lookup()

```
template<std::size_t Size = 1024U>
Port_iface * Mac_table< Size >::lookup (
    Mac_addr dst,
    14_uint16_t vlan_id) const [inline]
```

Find the destination port for a MAC address and VLAN id.

#### Parameters

<i>dst</i>	MAC address
<i>vlan↔ _id</i>	VLAN id

### Return values

<i>nullptr</i>	The MAC address is not known (yet)
<i>other</i>	Pointer to the destination port

Definition at line 58 of file [mac\\_table.h](#).

Referenced by [learn\(\)](#).

Here is the caller graph for this function:

The documentation for this class was generated from the following file:

- `pkg/virtio-net-switch/server/switch/mac_table.h`

## 16.443 Net\_transfer Class Reference

A network request to only a single destination.

```
#include <request.h>
```

Collaboration diagram for Net\_transfer:

### Public Member Functions

- void const \* **req\_id** () const  
*Identifier for the underlying Net\_request, used for logging purposes.*
- virtual void **copy\_header** (Virtio\_net::Hdr \*dst\_header) const =0  
*Populate the virtio-net header for the destination.*
- [Buffer](#) & **cur\_buf** ()  
*[Buffer](#) containing (a part of) the packet data.*
- virtual bool **done** ()=0  
*Check whether the transfer has been completed, i.e.*

### 16.443.1 Detailed Description

A network request to only a single destination.

A `Net_request` can have multiple destinations (being a broadcast request, for example). That is why it is processed by multiple `Net_transfers`, each representing the delivery to a single destination port.

`Port_iface::handle_request` uses the `Net_transfer` to move one packet to the destination of the request.

Definition at line 33 of file [request.h](#).

## 16.443.2 Member Function Documentation

### 16.443.2.1 `cur_buf()`

```
Buffer & Net_transfer::cur_buf () [inline]
```

`Buffer` containing (a part of) the packet data.

Once emptied, a call to `done ()` might replenish the buffer, in case the net request consisted of multiple chained buffers.

Definition at line 54 of file [request.h](#).

### 16.443.2.2 `done()`

```
virtual bool Net_transfer::done () [pure virtual]
```

Check whether the transfer has been completed, i.e.

the entire packet data has been copied.

#### Return values

<i>false</i>	There is remaining packet data that needs to be copied.
<i>true</i>	The entire packet data has been copied.

#### Exceptions

<a href="#">L4virtio::Svr::Bad_descriptor</a>	Exception raised in SRC port queue.
---	-------------------------------------

The documentation for this class was generated from the following file:

- `pkg/virtio-net-switch/server/switch/request.h`

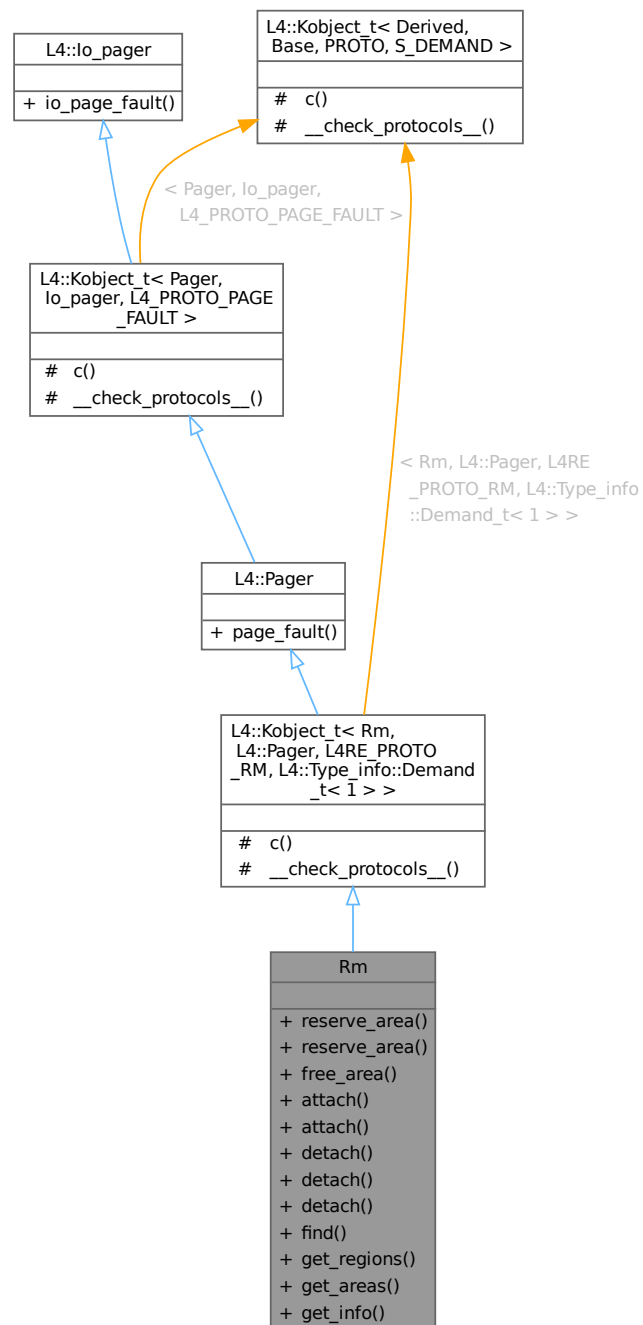

## 16.444 Rm Class Reference

Region map.

```
long L4Re::Rm::attach (
    l4_addr_t * start,
    unsigned long size,
    Rm::Flags flags,
    L4::Ipc::Cap< Dataspace > mem,
    Rm::Offset offs = 0,
    unsigned char align = L4_PAGESHIFT,
    L4::Cap< L4::Task > const task = L4::Cap<L4::Task>::Invalid,
    char const * name = nullptr,
    Rm::Offset backing_offset = 0) const [noexcept]
```

Attach a data space to a region.

#### Parameters

in, out	<i>start</i>	Virtual start address where the region manager shall attach the data space. Will be rounded down to the nearest start of a page. If <a href="#">L4Re::Rm::F::Search_addr</a> is given this value is used as the start address to search for a free virtual memory region and the resulting address is returned here. If <a href="#">L4Re::Rm::F::In_area</a> is given the value is used as a selector for the area (see <a href="#">L4Re::Rm::reserve_area</a> ) to attach the data space to.
	<i>size</i>	Size of the data space to attach (in bytes). Will be rounded up to the nearest multiple of the page size.

	<i>flags</i>	The flags control how and with which rights the dataspace is attached to the region. See <a href="#">L4Re::Rm::F::Attach_flags</a> and <a href="#">L4Re::Rm::F::Region_flags</a> . The caller must specify the desired rights of the attached region explicitly. The default set of rights is empty. If the <a href="#">F::Eager_map</a> flag is set this function may also return <a href="#">L4Re::Dataspace::map</a> error codes if the mapping fails.
	<i>mem</i>	Data space.
	<i>offs</i>	Offset into the data space to use.
	<i>align</i>	Alignment of the virtual region, log2-size, default: a page ( <a href="#">L4_PAGESHIFT</a> ). This is only meaningful if the <a href="#">L4Re::Rm::F::Search_addr</a> flag is used.
	<i>task</i>	Optional destination task of mapping if <a href="#">F::Eager_map</a> flag was passed. If invalid, the mapping is established in the current task. This parameter is only useful if the region manager is for a foreign task.
	<i>name</i>	Optional name of the region.
	<i>backing_offset</i>	Optional value describing an offset into the backing store of this region.

### Return values

0	Success
-L4_ENOENT	No area could be found (see <a href="#">L4Re::Rm::F::In_area</a> )
-L4_EPERM	Operation not allowed.
-L4_EINVAL	
-L4_EADDRNOTAVAIL	The given address is not available.
<0	IPC errors

Makes the whole or parts of a data space visible in the virtual memory of the corresponding task. The corresponding region in the virtual address space is backed with the contents of the dataspace.

### Note

When searching for a free place in the virtual address space, the space between *start* and the end of the virtual address space is searched.

There is no region object created, instead the region is defined by a virtual address within this range (see [L4Re::Rm::find](#)).

Definition at line 34 of file [rm\\_impl.h](#).

### 16.444.3.2 attach() [2/2]

```
template<typename T>
long L4Re::Rm::attach (
    T ** start,
    unsigned long size,
    Flags flags,
    L4::Ipc::Cap< Dataspace > mem,
    Offset offs = 0,
    unsigned char align = L4_PAGESHIFT,
    L4::Cap< L4::Task > const task = L4::Cap<L4::Task>::Invalid,
```

```
char const * name = nullptr,  
Offset backing_offset = 0) const [inline], [noexcept]
```

Attach a data space to a region.

#### Parameters

---

<i>in, out</i>	<i>start</i>	Virtual start address where the region manager shall attach the data space. Will be rounded down to the nearest start of a page. If <a href="#">L4Re::Rm::F::Search_addr</a> is given this value is used as the start address to search for a free virtual memory region and the resulting address is returned here. If <a href="#">L4Re::Rm::F::In_area</a> is given the value is used as a selector for the area (see <a href="#">L4Re::Rm::reserve_area</a> ) to attach the data space to.
	<i>size</i>	Size of the data space to attach (in bytes). Will be rounded up to the nearest multiple of the page size.
	<i>flags</i>	The flags control how and with which rights the dataspace is attached to the region. See <a href="#">L4Re::Rm::F::Attach_flags</a> and <a href="#">L4Re::Rm::F::Region_flags</a> . The caller must specify the desired rights of the attached region explicitly. The default set of rights is empty. If the <a href="#">F::Eager_map</a> flag is set this function may also return <a href="#">L4Re::Dataspace::map</a> error codes if the mapping fails.
	<i>mem</i>	Data space.
	<i>offs</i>	Offset into the data space to use.
	<i>align</i>	Alignment of the virtual region, log2-size, default: a page ( <a href="#">L4_PAGESHIFT</a> ). This is only meaningful if the <a href="#">L4Re::Rm::F::Search_addr</a> flag is used.
	<i>task</i>	Optional destination task of mapping if <a href="#">F::Eager_map</a> flag was passed. If invalid, the mapping is established in the current task. This parameter is only useful if the region manager is for a foreign task.
	<i>name</i>	Optional name of the region.
	<i>backing_offset</i>	Optional value describing an offset into the backing store of this region.

### Return values

<i>0</i>	Success
<i>-L4_ENOENT</i>	No area could be found (see <a href="#">L4Re::Rm::F::In_area</a> )
<i>-L4_EPERM</i>	Operation not allowed.
<i>-L4_EINVAL</i>	
<i>-L4_EADDRNOTAVAIL</i>	The given address is not available.
<i>&lt;0</i>	IPC errors

Makes the whole or parts of a data space visible in the virtual memory of the corresponding task. The corresponding region in the virtual address space is backed with the contents of the dataspace.

### Note

When searching for a free place in the virtual address space, the space between *start* and the end of the virtual address space is searched.

There is no region object created, instead the region is defined by a virtual address within this range (see [L4Re::Rm::find](#)).

Definition at line 409 of file [rm](#).

### 16.444.3.3 detach() [1/3]

```
int L4Re::Rm::detach (
    l4_addr_t addr,
```

```

L4::Cap< Dataspace > * mem,
L4::Cap< L4::Task > const & task = This_task) const [inline], [noexcept]

```

Detach and unmap a region from the address space.

### Parameters

	<i>addr</i>	Virtual address of region, any address within the region is valid.
out	<i>mem</i>	Dataspace that is affected. Give 0 if not interested.
	<i>task</i>	This argument specifies the task where the pages are unmapped. Provide <a href="#">L4::Cap&lt;L4::Task&gt;::Invalid</a> for none. The default is the current task.

### Return values

<a href="#">L4Re::Rm::Detach_result</a>	On success.
<a href="#">-L4_ENOENT</a>	No region found.
<a href="#">&lt;0</a>	IPC errors

Frees a region in the virtual address space given by *addr* (address type). The corresponding part of the address space is now available again.

Definition at line 765 of file [rm](#).

### 16.444.3.4 detach() [2/3]

```

int L4Re::Rm::detach (
    l4_addr_t start,
    unsigned long size,
    L4::Cap< Dataspace > * mem,
    L4::Cap< L4::Task > const & task) const [inline], [noexcept]

```

Detach and unmap all parts of the regions within the specified interval.

### Parameters

	<i>start</i>	Start of area to detach, must be within region.
	<i>size</i>	Size of of area to detach (in bytes).
out	<i>mem</i>	Dataspace that is affected. Give 0 if not interested.
	<i>task</i>	This argument specifies the task where the pages are unmapped. Provide <a href="#">L4::Cap&lt;L4::Task&gt;::Invalid</a> for none. The default is the current task.

### Return values

<a href="#">L4Re::Rm::Detach_result</a>	On success.
<a href="#">-L4_ENOENT</a>	No region found.
<a href="#">&lt;0</a>	IPC errors

Frees all regions within the interval given by start and size. If a region overlaps the start or the end of the interval this region is only detached partly. If the interval is within one region the original region is split up into two separate regions.

Definition at line 778 of file [rm](#).

### 16.444.3.5 detach() [3/3]

```
int L4Re::Rm::detach (
    void * addr,
    L4::Cap< Dataspace > * mem,
    L4::Cap< L4::Task > const & task = This_task) const [inline], [noexcept]
```

Detach and unmap a region from the address space.

#### Parameters

	<i>addr</i>	Virtual address of region, any address within the region is valid.
out	<i>mem</i>	Dataspace that is affected. Give 0 if not interested.
	<i>task</i>	This argument specifies the task where the pages are unmapped. Provide <a href="#">L4::Cap&lt;L4::Task&gt;::Invalid</a> for none. The default is the current task.

#### Return values

<a href="#">L4Re::Rm::Detach_result</a>	On success.
<a href="#">-L4_ENOENT</a>	No region found.
<a href="#">&lt;0</a>	IPC errors

Frees a region in the virtual address space given by addr (address type). The corresponding part of the address space is now available again.

Definition at line 770 of file [rm](#).

### 16.444.3.6 find()

```
long L4Re::Rm::find (
    l4_addr_t * addr,
    unsigned long * size,
    Offset * offset,
    L4Re::Rm::Flags * flags,
    L4::Cap< Dataspace > * m) [inline], [noexcept]
```

Find a region given an address and size.

#### Parameters

in, out	<i>addr</i>	Address to look for. Returns the start address of the found region.
---------	-------------	---

in, out	<i>size</i>	Size of the area to look for (in bytes). Returns the size of the found region (in bytes).
out	<i>offset</i>	Offset at the beginning of the region within the associated dataspace.
out	<i>flags</i>	<a href="#">Region flags</a> , see <a href="#">F::Region_flags</a> (and <a href="#">F::ln_area</a> ).
out	<i>m</i>	Associated dataspace or paging service.

### Return values

0	Success
-L4_EPERM	Operation not allowed.
-L4_ENOENT	No region found.
<0	IPC errors

This function returns the properties of the region that contains the area described by the `addr` and `size` parameter. If no such region is found but a reserved area, the area is returned and [F::ln\\_area](#) is set in `flags`. Note, in the case of an area the `offset` and `m` return values are invalid.

### Note

The value of the `size` input parameter should be 1 to assure that a region can be determined unambiguously.

Definition at line [672](#) of file [rm](#).

### 16.444.3.7 free\_area()

```
long L4Re::Rm::free_area (
    l4_addr_t addr)
```

Free an area from the region map.

### Parameters

<i>addr</i>	An address within the area to free.
-------------	-------------------------------------

### Return values

0	Success
-L4_ENOENT	No area found.
<0	IPC errors

**Note**

The data spaces that are attached to that area are not detached by this operation.

**See also**

[reserve\\_area\(\)](#) for more information about areas.

**16.444.3.8 get\_areas()**

```
long L4Re::Rm::get_areas (
    l4_addr_t start,
    L4::Ipc::Ret_array< Area > areas)
```

Return the list of areas whose starting addresses are higher or equal to `start` in the address space managed by this region map.

**Parameters**

	<i>start</i>	Virtual address from where to start searching.
out	<i>areas</i>	List of areas found in this region map.

**Return values**

$\geq 0$	Number of returned areas in the <code>areas</code> array.
<0	IPC errors

**Note**

The returned list of areas might not be complete and the caller shall use the function repeatedly with a start address one larger than the end address of the last area from the previous call.

**16.444.3.9 get\_info()**

```
long L4Re::Rm::get_info (
    l4_addr_t addr,
    L4::Ipc::String< char > & name,
    Offset & backing_offset)
```

Return auxiliary information of a region.

This is a debugging feature and might not be available.

**Parameters**

	<i>addr</i>	Virtual address of the region.
out	<i>name</i>	Name of the region.
out	<i>backing_offset</i>	Backing offset information.

#### Return values

0	Success
-L4_ENOENT	<a href="#">Region</a> not found.
-L4_ENOSYS	Function not available.
<0	IPC errors

#### 16.444.3.10 `get_regions()`

```
long L4Re::Rm::get_regions (
    l4_addr_t start,
    L4::Ipc::Ret_array< Region > regions)
```

Return the list of regions whose starting addresses are higher or equal to `start` in the address space managed by this region map.

#### Parameters

	<i>start</i>	Virtual address from where to start searching.
out	<i>regions</i>	List of regions found in this region map.

#### Return values

$\geq 0$	Number of returned regions in the <code>regions</code> array.
<0	IPC errors

#### Note

The returned list of regions might not be complete and the caller shall use the function repeatedly with a start address one larger than the end address of the last region from the previous call.

#### 16.444.3.11 `reserve_area()` [1/2]

```
long L4Re::Rm::reserve_area (
    l4_addr_t * start,
    unsigned long size,
    Flags flags = Flags(0),
    unsigned char align = L4\_PAGESHIFT) const [inline], [noexcept]
```

Reserve the given area in the region map.

#### Parameters

<i>in, out</i>	<i>start</i>	The virtual start address of the area to reserve. Returns the start address of the area.
	<i>size</i>	The size of the area to reserve (in bytes).
	<i>flags</i>	Flags for the reserved area (see <a href="#">L4Re::Rm::F::Region_flags</a> and <a href="#">L4Re::Rm::F::Attach_flags</a> ).
	<i>align</i>	Alignment of area if searched as bits (log2 value).

### Return values

0	Success
-L4_EADDRNOTAVAIL	The given area cannot be reserved.
<0	IPC errors

This function reserves an area within the virtual address space managed by the region map. There are two kinds of areas available:

- Reserved areas (*flags* = [L4Re::Rm::F::Reserved](#)), where no data spaces can be attached
- Special purpose areas (*flags* = 0), where data spaces can be attached to the area via the [L4Re::Rm::F::In\\_area](#) flag and a start address within the area itself.

### Note

When searching for a free place in the virtual address space (with *flags* = [L4Re::Rm::F::Search\\_addr](#)), the space between *start* and the end of the virtual address space is searched.

Definition at line 280 of file [rm](#).

### 16.444.3.12 reserve\_area() [2/2]

```
template<typename T>
long L4Re::Rm::reserve_area (
    T ** start,
    unsigned long size,
    Flags flags = Flags(0),
    unsigned char align = L4_PAGESHIFT) const [inline], [noexcept]
```

Reserve the given area in the region map.

### Parameters

<i>in, out</i>	<i>start</i>	The virtual start address of the area to reserve. Returns the start address of the area.
	<i>size</i>	The size of the area to reserve (in bytes).
	<i>flags</i>	Flags for the reserved area (see <a href="#">F::Region_flags</a> and <a href="#">F::Attach_flags</a> ).
	<i>align</i>	Alignment of area if searched as bits (log2 value).

### Return values

0	Success
-L4_EADDRNOTAVAIL	The given area cannot be reserved.
<0	IPC errors

For more information, please refer to the analogous function

### 16.446.2 Member Enumeration Documentation

#### 16.446.2.1 Attach\_flags

```
enum L4Re::Rm::F::Attach_flags : l4_uint32_t
```

Flags for attach operation.

#### Enumerator

Search_addr	Search for a suitable address range.
In_area	Search only in area, or map into area.
Eager_map	Eagerly map the attached data space in.
No_eager_map	Prevent eager mapping of the attached data space.
Attach_mask	Mask of all attach flags.

Definition at line 111 of file [rm](#).

#### 16.446.2.2 Region\_flags

```
enum L4Re::Rm::F::Region_flags : 14_uint16_t
```

[Region](#) flags (permissions, cacheability, special).

##### Enumerator

Rights_mask	<a href="#">Region</a> rights.
R	Readable region.
W	Writable region.
X	Executable region.
RW	Readable and writable region.
RX	Readable and executable region.
RWX	Readable, writable and executable region.
Kernel	Kernel-provided memory (KUMEM).
Detach_free	Free the portion of the data space after detach.
Pager	<a href="#">Region</a> has a pager.
Reserved	<a href="#">Region</a> is reserved (blocked).
Caching_mask	Mask of all <a href="#">Rm</a> cache bits.
Cache_normal	Cache bits for normal cacheable memory. This is the default if no other cache-related flag was specified.
Cache_buffered	Cache bits for buffered (write combining) memory.
Cache_uncached	Cache bits for uncached memory.
Ds_map_mask	Mask for all bits for cache options and rights.
Region_flags_mask	Mask of all region flags.

## 16.448.1 Detailed Description

```
template<typename T>
class Rm::Unique_region< T >
```

Unique region.

Capture a single region with automatic detach on destruction and unique ownership. Stores the start address and the region-mapper capability internally. A unique region is valid precisely if the internal region-mapper capability is valid. The features for unique ownership and automatic detach are only active for valid unique regions.

Definition at line [435](#) of file [rm](#).

## 16.448.2 Constructor & Destructor Documentation

### 16.448.2.1 Unique\_region() [1/3]

```
template<typename T>
L4Re::Rm::Unique\_region< T >::Unique_region (
    T addr) [inline], [explicit], [noexcept]
```

Construct a [Unique\\_region](#) from an address.

No region manager is set.

#### Parameters

---

<i>addr</i>	The new address
-------------	-----------------

Definition at line 456 of file [rm](#).

#### 16.448.2.2 Unique\_region() [2/3]

```
template<typename T>
L4Re::Rm::Unique_region< T >::Unique_region (
    T addr,
    L4::Cap< Rm > const & rm) [inline], [noexcept]
```

Construct a valid [Unique\\_region](#) from an address and a region manager.

##### Parameters

<i>addr</i>	The address
<i>rm</i>	The region manager

Definition at line 465 of file [rm](#).

#### 16.448.2.3 Unique\_region() [3/3]

```
template<typename T>
L4Re::Rm::Unique_region< T >::Unique_region (
    Unique_region< T > && o) [inline], [noexcept]
```

Move-Construct a [Unique\\_region](#).

##### Parameters

<i>o</i>	L-value reference to other region.
----------	------------------------------------

Definition at line 473 of file [rm](#).

#### 16.448.2.4 ~Unique\_region()

```
template<typename T>
L4Re::Rm::Unique_region< T >::~~Unique_region () [inline], [noexcept]
```

Destructor.

If the region is valid, call [detach](#).

Definition at line 498 of file [rm](#).

### 16.448.3 Member Function Documentation

#### 16.448.3.1 get()

```
template<typename T>
T L4Re::Rm::Unique_region< T >::get () const [inline], [noexcept]
```

Return the address.

##### Returns

the address

Definition at line 509 of file [rm](#).

#### 16.448.3.2 is\_valid()

```
template<typename T>
bool L4Re::Rm::Unique_region< T >::is_valid () const [inline], [noexcept]
```

Check if the [Unique\\_region](#) is valid.

##### Returns

true iff the [Unique\\_region](#) is valid

Definition at line 549 of file [rm](#).

#### 16.448.3.3 operator=()

```
template<typename T>
Unique_region & L4Re::Rm::Unique_region< T >::operator= (
    Unique_region< T > && o) [inline], [noexcept]
```

Move-assign a [Unique\\_region](#).

##### Parameters

<i>o</i>	L-value reference to region to assign from
----------	--

Definition at line 481 of file [rm](#).

#### 16.448.3.4 release()

```
template<typename T>
T L4Re::Rm::Unique_region< T >::release () [inline], [noexcept]
```

Return the address and invalidate the [Unique\\_region](#).

##### Returns

the address

Definition at line 517 of file [rm](#).

### 16.448.3.5 reset()

```
template<typename T>
void L4Re::Rm::Unique_region< T >::reset (
    T addr,
    L4::Cap< Rm > const & rm) [inline], [noexcept]
```

Set new address and region manager.

#### Parameters

<i>addr</i>	The new address
<i>rm</i>	The new region manager

Definition at line 529 of file [rm](#).

The documentation for this class was generated from the following file:

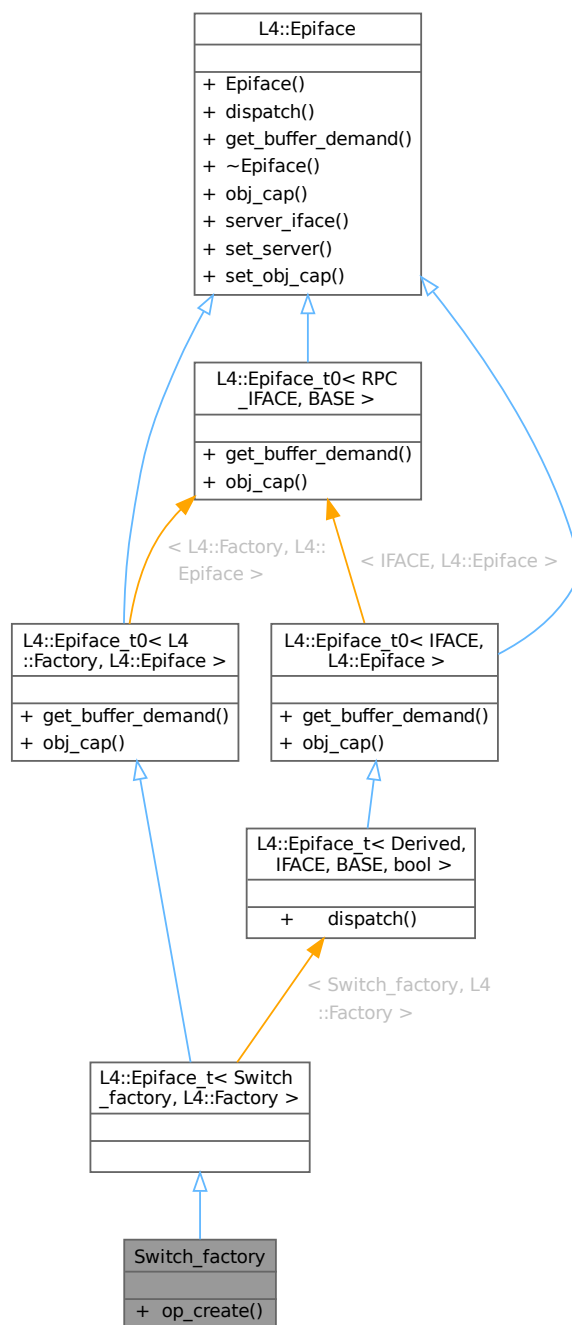

- [l4/re/rm](#)

## 16.449 Switch\_factory Class Reference

The IPC interface for creating ports.

Inheritance diagram for Switch\_factory:

### 16.449.1 Detailed Description

The IPC interface for creating ports.

The Switch factory provides an IPC interface to create ports. Ports are the only option for a client to communicate with the switch and, thus, with other network devices.

The `Switch_factory` gets constructed when the net switch application gets started. It thereafter gets registered on the switch's server to serve IPC `create` calls.

Definition at line 114 of file `main.cc`.

## 16.449.2 Member Function Documentation

### 16.449.2.1 op\_create()

```
long Switch_factory::op_create (
    L4::Factory::Rights ,
    L4::Ipc::Cap< void > & res,
    l4_umword_t type,
    L4::Ipc::Varg_list_ref va) [inline]
```

Handle factory protocol.

This function is invoked after an incoming factory::create request and creates a new port or statistics interface if possible.

Definition at line 528 of file [main.cc](#).

References [L4\\_EINVAL](#).

The documentation for this class was generated from the following file:

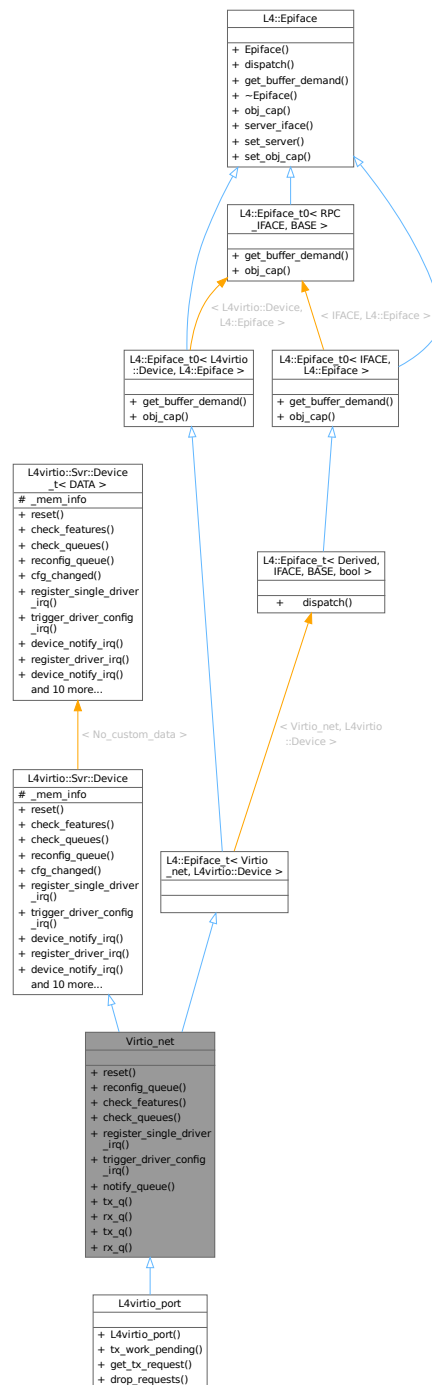

- pkg/virtio-net-switch/server/switch/main.cc

## 16.450 Virtio\_net Class Reference

### 16.450.1 Detailed Description

The Base class of a Port.

This class provides the Virtio network protocol specific implementation aspects of a port.

[Virtio\\_net](#) comprises the virtqueues for both, the incoming and the outgoing network requests:

- The transmission queue, containing requests to be transmitted to other ports. The transmission queue is filled by the client, this port relates to.
- The receive queue, containing requests that have been transmitted from other ports. The receive queue is filled by the switch.

Definition at line 71 of file [virtio\\_net.h](#).

### 16.450.2 Member Function Documentation

#### 16.450.2.1 notify\_queue()

```
void Virtio_net::notify_queue (
    L4virtio::Svr::Virtqueue * queue) [inline]
```

Trigger the `_kick_guest_irq` IRQ.

This function gets called on the receiving port, when a request was successfully transmitted by the switch.

Definition at line 269 of file [virtio\\_net.h](#).

References [L4VIRTIO\\_IRQ\\_STATUS\\_VRING](#).

The documentation for this class was generated from the following file:

- `pkg/virtio-net-switch/server/switch/virtio_net.h`

## 16.451 Virtio\_net\_request Class Reference

Abstraction for a network request.

```
#include <request_l4virtio.h>
```

Collaboration diagram for `Virtio_net_request`:

## Public Member Functions

- [Mac\\_addr dst\\_mac](#) () const  
*Get the Mac address of the destination port.*
- [Mac\\_addr src\\_mac](#) () const  
*Get the Mac address of the source port.*

## Static Public Member Functions

- static void [drop\\_requests](#) ([Virtio\\_net](#) \*dev, [L4virtio::Svr::Virtqueue](#) \*queue)  
*Drop all requests of a specific queue.*
- static std::optional< [Virtio\\_net\\_request](#) > [get\\_request](#) ([Virtio\\_net](#) \*dev, [L4virtio::Svr::Virtqueue](#) \*queue)  
*Construct a request from the next entry of a provided queue.*

### 16.451.1 Detailed Description

Abstraction for a network request.

A [Virtio\\_net\\_request](#) is constructed by the source port, using the static function [get\\_request](#) () as part of [Port\\_iface::get\\_tx\\_request](#) ().

On destruction, [finish](#) () will be called, which, will trigger the client IRQ of the source client.

Definition at line 35 of file [request\\_l4virtio.h](#).

### 16.451.2 Member Function Documentation

#### 16.451.2.1 drop\_requests()

```
void Virtio_net_request::drop_requests (
    Virtio_net * dev,
    L4virtio::Svr::Virtqueue * queue) [inline], [static]
```

Drop all requests of a specific queue.

This function is used for example to drop all requests in the transmission queue of a monitor port, since monitor ports are not allowed to transmit data.

#### Parameters

<i>dev</i>	Port of the provided virtqueue.
<i>queue</i>	Virtqueue to drop all requests of.

Definition at line 172 of file [request\\_l4virtio.h](#).

References [L4virtio::Svr::Virtqueue::desc\\_avail](#) (), [L4virtio::Svr::Virtqueue::finish](#) (), [L4\\_UNLIKELY](#), [L4virtio::Svr::Virtqueue::next\\_avail](#) (), [L4virtio::Virtqueue::ready](#) (), and [L4virtio::Svr::Request\\_processor::start](#) ().

Referenced by [L4virtio\\_port::drop\\_requests](#) ().

Here is the call graph for this function:

Here is the caller graph for this function:

### 16.451.2.2 get\_request()

```

std::optional< Virtio_net_request > Virtio_net_request::get_request (
    Virtio_net * dev,
    L4virtio::Svr::Virtqueue * queue) [inline], [static]
  
```

Construct a request from the next entry of a provided queue.

#### Parameters

<i>dev</i>	Port of the provided virtqueue.
<i>queue</i>	Virtqueue to extract next entry from.

Definition at line 199 of file [request\\_l4virtio.h](#).

References [L4\\_UNLIKELY](#), [L4virtio::Svr::Virtqueue::next\\_avail\(\)](#), and [L4virtio::Virtqueue::ready\(\)](#).

Referenced by [L4virtio\\_port::get\\_tx\\_request\(\)](#).

Here is the call graph for this function:

Here is the caller graph for this function:

The documentation for this class was generated from the following file:

- `pkg/virtio-net-switch/server/switch/request_l4virtio.h`

## 16.452 Virtio\_switch Class Reference

The Virtio switch contains all ports and processes network requests.

```
#include <switch.h>
```

Collaboration diagram for Virtio\_switch:

### Public Member Functions

- [Virtio\\_switch](#) (unsigned max\_ports)  
*Create a switch with n ports.*
- bool [add\\_port](#) (Port\_iface \*port)  
*Add a port to the switch.*
- bool [add\\_monitor\\_port](#) (Port\_iface \*port)  
*Add a monitor port to the switch.*
- void [check\\_ports](#) ()  
*Check validity of ports.*
- bool [handle\\_l4virtio\\_port\\_tx](#) (L4virtio\_port \*port)  
*Handle TX queue of the given port.*
- int [port\\_available](#) (bool monitor)  
*Is there still a free port on this switch available?*

## 16.452.1 Detailed Description

The Virtio switch contains all ports and processes network requests.

A Port on its own is not capable to process an incoming network request because it has no knowledge about other ports. The processing of an incoming request therefore gets delegated to the switch.

The [Virtio\\_switch](#) is constructed at the start of the Virtio Net Switch application. The factory saves a reference to it to pass it to the [Kick\\_irq](#) on port creation.

Definition at line 33 of file [switch.h](#).

## 16.452.2 Constructor & Destructor Documentation

### 16.452.2.1 Virtio\_switch()

```
Virtio_switch::Virtio_switch (
    unsigned max_ports) [explicit]
```

Create a switch with n ports.

### Parameters

<i>max_ports</i>	maximal number of provided ports
------------------	----------------------------------

Definition at line 12 of file [switch.cc](#).

## 16.452.3 Member Function Documentation

### 16.452.3.1 add\_monitor\_port()

```
bool Virtio_switch::add_monitor_port (  
    Port_iface * port)
```

Add a monitor port to the switch.

#### Parameters

<i>port</i>	A pointer to an already constructed Port_iface object.
-------------	--

#### Return values

<i>true</i>	Port was added successfully.
<i>false</i>	Switch was not able to add the port.

Definition at line 54 of file [switch.cc](#).

### 16.452.3.2 add\_port()

```
bool Virtio_switch::add_port (  
    Port_iface * port)
```

Add a port to the switch.

#### Parameters

<i>port</i>	A pointer to an already constructed Port_iface object.
-------------	--

#### Return values

<i>true</i>	Port was added successfully.
<i>false</i>	Switch was not able to add the port.

Definition at line 29 of file [switch.cc](#).

References [Mac\\_addr::is\\_unknown\(\)](#).

Here is the call graph for this function:

### 16.452.3.3 check\_ports()

```
void Virtio_switch::check_ports ()
```

Check validity of ports.

Check whether all ports are still used and remove any unused (unreferenced) ports. Shall be invoked after an incoming cap deletion irq to remove ports without clients.

Definition at line 69 of file [switch.cc](#).

### 16.452.3.4 handle\_l4virtio\_port\_tx()

```
bool Virtio_switch::handle_l4virtio_port_tx (
    L4virtio_port * port)
```

Handle TX queue of the given port.

#### Parameters

<i>port</i>	<a href="#">L4virtio_port</a> to handle pending TX work for.
-------------	--

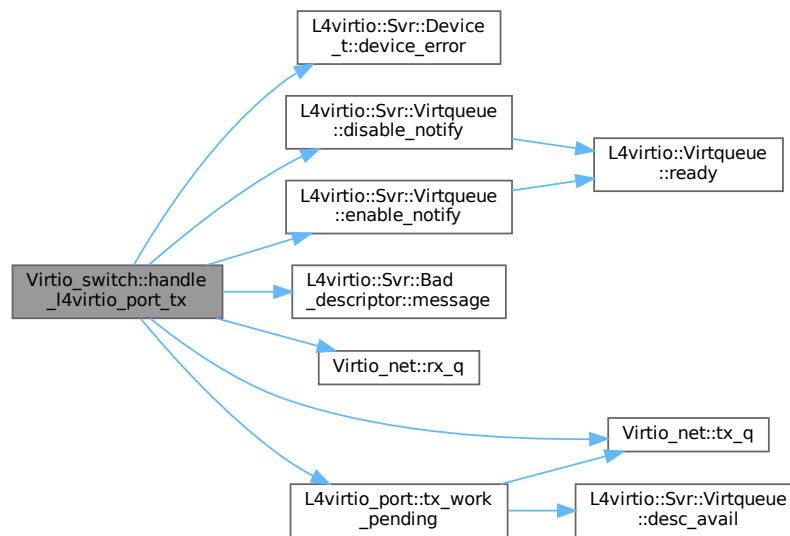

#### Return values

<i>false</i>	Port hit its TX burst limit, and thus a TX pending reschedule notification was queued.
<i>true</i>	Port's entire TX queue was processed.

Definition at line 194 of file [switch.cc](#).

References [L4virtio::Svr::Device\\_t< DATA >::device\\_error\(\)](#), [L4virtio::Svr::Virtqueue::disable\\_notify\(\)](#), [L4virtio::Svr::Virtqueue::enable\\_notify\(\)](#), [L4virtio::Svr::Bad\\_descriptor::message\(\)](#), [Virtio\\_net::rx\\_q\(\)](#), [Virtio\\_net::tx\\_q\(\)](#), and [L4virtio\\_port::tx\\_work\\_pending\(\)](#).

Here is the call graph for this function:

### 16.452.3.5 port\_available()

```
int Virtio_switch::port_available (
    bool monitor) [inline]
```

Is there still a free port on this switch available?

#### Parameters

<i>monitor</i>	True if we look for a monitor slot.
----------------	-------------------------------------

#### Return values

$\geq 0$	The next available port index.
-1	No port available.

Definition at line 148 of file [switch.h](#).

The documentation for this class was generated from the following files:

- `pkg/virtio-net-switch/server/switch/switch.h`
- `pkg/virtio-net-switch/server/switch/switch.cc`

## 16.453 Virtio\_vlan\_mangle Class Reference

Class for VLAN packet rewriting.

```
#include <vlan.h>
```

Collaboration diagram for Virtio\_vlan\_mangle:

Virtio_vlan_mangle
<ul style="list-style-type: none"><li>+ Virtio_vlan_mangle()</li><li>+ copy_pkt()</li><li>+ rewrite_hdr()</li><li>+ add()</li><li>+ remove()</li></ul>

### Public Member Functions

*Construct an object that removes the VLAN tag.*

### 16.453.1 Detailed Description

Class for VLAN packet rewriting.

Definition at line 36 of file [vlan.h](#).

## 16.453.2 Constructor & Destructor Documentation

### 16.453.2.1 Virtio\_vlan\_mangle()

```
Virtio_vlan_mangle::Virtio_vlan_mangle () [inline]
```

Default constructor.

The packet is not touched in any way.

Definition at line 52 of file [vlan.h](#).

Referenced by [add\(\)](#), and [remove\(\)](#).

Here is the caller graph for this function:

## 16.453.3 Member Function Documentation

### 16.453.3.1 add()

```
constexpr Virtio_vlan_mangle Virtio_vlan_mangle::add (
    14_uint16_t tci) [inline], [static], [constexpr]
```

Construct an object that adds a VLAN tag.

#### Parameters

<i>tci</i>	The TCI field of the VLAN tag to add.
------------	---------------------------------------

It is the callers responsibility to ensure that the packet is not already tagged.

Definition at line 64 of file [vlan.h](#).

References [Virtio\\_vlan\\_mangle\(\)](#).

Here is the call graph for this function:

### 16.453.3.2 copy\_pkt()

```
l4_uint32_t Virtio_vlan_mangle::copy_pkt (
    Buffer & dst,
    Buffer & src) [inline]
```

Copy packet from *src* to *dst*.

#### Parameters

<i>src</i>	Source packet buffer
<i>dst</i>	Destination packet buffer

#### Returns

The number of bytes copied

Copy the data from *src* to *dst*, possibly rewriting parts of the packet. The method is expected to be called repeatedly until the source packet is finished. Partial copies are allowed (including reading nothing from the source buffer) as long as progress is made, i.e. repeatedly calling this function eventually consumes the source buffer.

Definition at line 93 of file [vlan.h](#).

References [L4virtio::Svr::Data\\_buffer::copy\\_to\(\)](#), [L4\\_LIKELY](#), [L4virtio::Svr::Data\\_buffer::left](#), [L4virtio::Svr::Data\\_buffer::pos](#), and [L4virtio::Svr::Data\\_buffer::skip\(\)](#).

Here is the call graph for this function:

### 16.453.3.3 remove()

```
constexpr Virtio_vlan_mangle Virtio_vlan_mangle::remove () [inline], [static], [constexpr]
```

Construct an object that removes the VLAN tag.

This object assumes that the Ethernet packet has a VLAN tag and will slavishly remove the necessary bytes from the packet.

Definition at line 75 of file [vlan.h](#).

References [Virtio\\_vlan\\_mangle\(\)](#).

Here is the call graph for this function:

#### 16.453.3.4 `rewrite_hdr()`

```
void Virtio_vlan_mangle::rewrite_hdr (  
    Virtio_net::Hdr * hdr) [inline]
```

Rewrite the virtio network header.

##### Parameters

<i>hdr</i>	The virtio header of the packet
------------	---------------------------------

This method is called exactly once for every virtio network packet. Any necessary changes to the header are done in-place.

Definition at line 142 of file [vlan.h](#).

References [L4\\_UNLIKELY](#).

The documentation for this class was generated from the following file:

- `pkg/virtio-net-switch/server/switch/vlan.h`

## 17.38 tutorial.lua

```

00001 local _doc = [=[
00002
00003 Tutorial lua script for Ned
00004 =====
00005
00006 Firstly we have a set of definitions available. Some come from 'ned.lua'
00007 embedded script and others from the C++ bindings within Ned. The whole L4
00008 functionality is in the lua module "L4" (use 'local L4 = require("L4");').
00009 The L4 module classes and functions cope with L4 capabilities and
00010 their invocations, provide a set of constants and access to the L4Re environment of
00011 the running program. Finally, of course it can also start L4 applications.
00012
00013 L4 Capabilities
00014 =====
00015
00016 The L4 module defines a user data type for capabilities. A capability in lua
00017 carries a typed L4 capability and is accompanied with a set of type specific
00018 methods that may be called on the object behind the capability. There also
00019 exists a way to cast a capability to a capability to a different type of
00020 object using L4.cast(type, cap).
00021
00022 L4.cast(type, cap)
00023
00024 Returns a cap transformed to a capability of the given type, whereas type
00025 is either the fully qualified C++ name of the class encapsulating the object
00026 or the L4 protocol ID assigned to all L4Re and L4 system objects.
00027 If the type is unknown then nil is returned.
00028
00029 Generic capabilities provide the following methods:
00030
00031 is_valid()
00032
00033 Returns true if the capability is not the invalid cap (L4_INVALID_CAP), and
00034 false if it is the invalid cap.
00035
00036
00037 L4Re::Namespace object
00038 =====
00039
00040 There is a lua type for name spaces that has the following methods:
00041
00042 query(name), or q(name)
00043
00044 Returns a closure (function) that initiates a query for the given name
00045 within the name space. The function takes no arguments and returns
00046 a capability if successful or nil if name is not found.
00047
00048
00049 link(name), or l(name)
00050
00051 Returns a function that can create a link to the given object in the name
00052 space if put into another name space. The function takes two parameters
00053 the target name space and the name in the target name space.
00054 Loader:create_namespace and Loader.fill_namespace calls this function
00055 when things are really put into an L4Re::Namespace.
00056
00057
00058 register(name, cap), or r(name, cap)
00059
00060 Registers the given object capability under the given name. cap can

```

```

00061  be either a real capability (note query returns a function), a string, or
00062  nil. If it is a capability it is just put into the name space.
00063  In the case cap is a string a placeholder will be put into the name space
00064  that will be replaced with a real capability later by some program.
00065  And if nil is use the name will be deleted from the name space.
00066
00067
00068  L4::Factory object
00069  =====
00070
00071  The factory object provides an interface to the generic create method of a
00072  factory.
00073
00074  create(proto, ...)
00075
00076  This method calls the factory to create an object of the given type,
00077  via the L4 protocol number (see L4.Proto table for more) all further
00078  arguments are passed to the factory.
00079
00080
00081  Access to the L4Re Env capabilities
00082  =====
00083
00084  The L4 module defines a table L4.Env that contains the capabilities
00085  of the L4Re::Env::env() environment. Namely:
00086
00087  factory      The kernel factory of Ned
00088  log           The log object of Ned
00089  user_factory The factory provided to Ned, including memory
00090  parent        The parent of Ned
00091  rm            The region map of Ned
00092  scheduler     The scheduler of Ned
00093
00094
00095  Some useful constants
00096  =====
00097
00098  L4.Proto table contains the most important protocol values for
00099  L4 and L4Re objects.
00100
00101  Namespace
00102  Goos
00103  Rm
00104  Irq
00105  Sigma0
00106  Factory
00107  Log
00108  Scheduler
00109
00110  The L4.Info table contains the following functions:
00111
00112  Kip.str()     The banner string found in the kernel info page
00113  arch()        Architecture name, such as: x86, amd64, arm, ppc32
00114  platform()    Platform name, such as: pc, ux, realview, beagleboard
00115  mword_bits() Number of native machine word bits (32, 64)
00116
00117
00118  Support for starting L4 programs
00119  =====
00120
00121  The L4 module defines two classes that are useful for starting L4 applications.
00122  The class L4.Loader that encapsulates a fairly high level policy
00123  that is useful for starting a whole set of processes. And the class L4.App_env
00124  that encapsulates a more fine-grained policy.
00125
00126  L4.Loader
00127  -----
00128
00129  The class L4.Loader encapsulates the policy for starting programs with the
00130  basic building blocks for the application coming from a dedicated loader,
00131  such as Moe or a Loader instance. These building blocks are a region map (Rm),
00132  a scheduler, a memory allocator, and a logging facility.
00133  A L4.Loader object is typically used to start multiple applications. There
00134  is a L4.default_loader instance of L4.Loader that uses the L4.Env.mem_alloc
00135  factory of the current Ned instance to create the objects for a new program.
00136  However you may also use a more restricted factory for applications and
00137  instantiate a loader for them. The L4.Loader objects can already be used
00138  to start a program with L4.Loader:start(app_spec, cmd, ...). Where app_spec
00139  is a table containing parameters for the new application. cmd is the
00140  command to run and the remaining arguments are the command-line options for
00141  the application.
00142
00143  ]==]
00144
00145  L4.default_loader:start({}, "rom/hello");
00146
00147  local _doc = [=[

```

```

00148
00149 This statement does the following:
00150 1. Create a new environment for the application
00151 2. Add the rom name-space into the new environment (thus shares Ned's
00152    'rom' directory with the new program).
00153 3. Creates all the building blocks for the new process and starts the
00154    'l4re' support kernel in the new process which in turn starts 'rom/hello'
00155    in the new process.
00156
00157 Using the app_spec parameter you can modify the behavior in two ways. There are
00158 two supported options 'caps' for providing more capabilities for the
00159 application. And 'log' for modifying the logger tag and color.
00160
00161 ]==]
00162
00163 local my_caps = {
00164     fb = L4.Env.vesa;
00165 };
00166
00167 L4.default_loader:start({caps = my_caps, log = {"APP", "blue"}}, "rom/hello");
00168
00169 local _doc = [=[
00170
00171 This snippet creates a caps template (my_caps) and uses it for the
00172 new process and also sets user-defined log tags. The L4.Loader:start method,
00173 however, automatically adds the 'rom' directory to the caps environment if
00174 not already specified in the template.
00175
00176 Environment variables may be given as a table in the third argument to
00177 start. Argument to the program are given space separated after the program
00178 name within a single string.
00179
00180 ]==]
00181
00182 L4.default_loader:start({}, "rom/program arg1 " .. arg2, { LD_DEBUG = 1 });
00183
00184 local _doc = [=[
00185
00186 L4.default_loader:startv is a variant of the start function that takes the
00187 arguments of the program as a single argument each. If the last argument to
00188 startv is a table it is interpreted as environment variables for the program.
00189 The above example would translate to:
00190
00191 ]==]
00192
00193 L4.default_loader:startv({}, "rom/program", "arg1", arg2, { LD_DEBUG = 1 });
00194
00195 local _doc = [=[
00196
00197 To create a new L4.Loader instance you may use a generic factory for all
00198 building blocks or set individual factories.
00199
00200 ]==]
00201
00202 l = L4.Loader.new({
00203     mem = L4.Env.user_factory:create(L4.Proto.Factory, 512*1024):m("rs")
00204 });
00205
00206 local _doc = [=[
00207
00208 Creates a loader instance that uses the newly created 512 KB factory for
00209 all building blocks. To set individual factories use the options:
00210     'mem'          as memory allocator for the new processes and as
00211                   default factory for all objects not explicitly set to a
00212                   different factory
00213     'log_fab'      for creating log objects.
00214     'ns_fab'       for creating name-space objects.
00215     'rm_fab'       for creating region-map objects.
00216
00217
00218
00219 L4.App_env
00220 -----
00221
00222 L4.App_env provides a more fine-grained control for a single process or for a
00223 limited number of processes. L4.App_env uses an L4.Loader object as basic
00224 facility. However you can override the memory allocator 'mem' for the new
00225 process as well as the kernel factory 'factory', the log capability etc.
00226
00227 ]==]
00228
00229 local e = L4.App_env.new({
00230     loader = l,
00231     mem = L4.Env.user_factory:create(L4.Proto.Factory, 128*1024):m("rs")
00232 });
00233
00234 e:start("rom/hello");

```

00194          * Header and csum offloading/general segmentation offloading
00195          *
00196          * We just copy the original header from source to
00197          * destination and have to consider three different
00198          * cases:
00199          * - no flags are set
00200          *   - we got a packet that is completely checksummed
00201          *     and correctly fragmented, there is nothing to
00202          *     do other than copying.
00203          * - virtio_net_hdr_f_needs_csum set
00204          *   - the packet is partially checksummed; if we would
00205          *     send the packet out on the wire we would have
00206          *     to calculate checksums now. But here we rely on
00207          *     the ability of our guest to handle partially
00208          *     checksummed packets and simply delegate the
00209          *     checksum calculation to them.
00210          * - gso_type != gso_none
00211          *   - the packet needs to be segmented; if we would
00212          *     send it out on the wire we would have to
00213          *     segment it now. But again we rely on the
00214          *     ability of our guest to handle gso
00215          *
00216          * We currently assume that our guests negotiated
00217          * virtio_net_f_guest_*, this needs to be checked in
00218          * the future.
00219          *
00220          * We also discussed the usage of
00221          * virtio_net_hdr_f_data_valid to remove the need to
00222          * checksum packets at all. But since our clients send
00223          * partially checksummed packets anyway the only
00224          * interesting case would be a packet without
00225          * net_hdr_f_needs_checksum set. In that case we would
00226          * signal that we checked the checksum and the
00227          * checksum is actually correct. Since we do not know
00228          * the origin of the packet (it could have been send
00229          * by an external node and could have been routed to
00230          * u) we can not signal this without actually
00231          * verifying the checksum. Otherwise a packet with an
00232          * invalid checksum could be successfully delivered.

## 17.79.1 Detailed Description

Segment handling (AMD64).

Definition in file [segment.h](#).

## 17.79.2 Enumeration Type Documentation

### 17.79.2.1 L4\_sys\_segment

```
enum L4_sys_segment
```

Constants for identifying segments.

#### Enumerator

L4_AMD64_SEGMENT_FS	Constant identifying the FS segment.
L4_AMD64_SEGMENT_GS	Constant identifying the GS segment.

Definition at line 106 of file [segment.h](#).

### 17.79.2.2 L4\_task\_ldt\_x86\_consts

```
enum L4_task_ldt_x86_consts
```

Constants for LDT handling.

#### Enumerator

L4_TASK_LDT_X86_ENTRY_SIZE	Size of an LDT entry.
L4_TASK_LDT_X86_MAX_ENTRIES	Maximum number of LDT entries that can be written with one call.

Definition at line 75 of file [segment.h](#).

## 17.79.3 Function Documentation

### 17.79.3.1 fiasco\_amd64\_segment\_info()

```
long fiasco_amd64_segment_info (  
    l4_cap_idx_t thread,  
    unsigned * user_ds,  
    unsigned * user_cs,  
    unsigned * user32_cs,  
    l4_utcb_t * utcb) [inline]
```

Get segment information.

#### Parameters

---

in	<i>thread</i>	Thread to get info from.
out	<i>user_ds</i>	DS segment selector.
out	<i>user_cs</i>	64-bit CS segment selector.
out	<i>user32_cs</i>	32-bit CS segment selector.
	<i>utcb</i>	UTCB to be used for this operation, shall be the UTCB of the calling thread. See <a href="#">l4_utcb</a> .

### Returns

System call error

Definition at line 175 of file [segment.h](#).

### 17.79.3.2 fiasco\_amd64\_set\_fs()

```

long fiasco_amd64_set_fs (
    l4_cap_idx_t thread,
    l4_umword_t base,
    l4_utcb_t * utcb) [inline]

```

Set the base address for the FS segment.

### Parameters

<i>thread</i>	Thread for which the FS base address shall be modified.
<i>base</i>	Base address.
<i>utcb</i>	UTCB to be used for this operation, shall be the UTCB of the calling thread. See <a href="#">l4_utcb</a> .

### Return values

<i>L4_EOK</i>	Success.
---------------	----------

<code>-L4_EINVAL</code>	Invalid base address ( <i>base</i> ).
<code>-L4_ENOSYS</code>	Operation not supported with current kernel configuration.

**Note**

Calling this function is equivalent to calling `fiasco_amd64_set_segment_base(thread, L4_↵AMD64_SEGMENT_FS, base, utcb)`.

Definition at line 24 of file [segment.h](#).

**17.79.3.3 fiasco\_amd64\_set\_segment\_base()**

```

long fiasco_amd64_set_segment_base (
    l4_cap_idx_t thread,
    enum L4_sys_segment segr,
    l4_umword_t base,
    l4_utcb_t * utcb) [inline]

```

Set the base address for a segment.

**Parameters**

<i>thread</i>	Thread for which the base address of the selected segment shall be modified.
<i>segr</i>	Segment to modify (one of <a href="#">L4_sys_segment</a> ).
<i>base</i>	Base address.
<i>utcb</i>	UTCB to be used for this operation, shall be the UTCB of the calling thread. See <a href="#">l4_utcb</a> .

**Return values**

<i>L4_EOK</i>	Success.
---------------	----------

<code>-L4_EINVAL</code>	Invalid segment ( <code>segr</code> ) or base address ( <code>base</code> ).
<code>-L4_ENOSYS</code>	Operation not supported with current kernel configuration.

Definition at line 32 of file [segment.h](#).

### 17.81.1 Detailed Description

l4f-specific fs/gs manipulation (AMD64).

Definition in file [segment.h](#).

### 17.81.2 Function Documentation

#### 17.81.2.1 fiasco\_amd64\_set\_fs()

```
long fiasco_amd64_set_fs (
    l4\_cap\_idx\_t thread,
    l4\_umword\_t base,
    l4\_utcb\_t * utcb) [inline]
```

Set the base address for the FS segment.

#### Parameters

---

<i>thread</i>	Thread for which the FS base address shall be modified.
<i>base</i>	Base address.
<i>utcb</i>	UTCB to be used for this operation, shall be the UTCB of the calling thread. See <a href="#">l4_utcb</a> .

### Return values

<i>L4_EOK</i>	Success.
<i>-L4_EINVAL</i>	Invalid base address ( <i>base</i> ).
<i>-L4_ENOSYS</i>	Operation not supported with current kernel configuration.

### Note

Calling this function is equivalent to calling `fiasco_amd64_set_segment_base(thread, L4_↔AMD64_SEGMENT_FS, base, utcb)`.

Definition at line 24 of file [segment.h](#).

References [L4\\_AMD64\\_SEGMENT\\_FS](#), [l4\\_ipc\\_call\(\)](#), [L4\\_IPC\\_NEVER](#), [l4\\_msgtag\(\)](#), [L4\\_PROTO\\_THREAD](#), and [L4\\_THREAD\\_AMD64\\_SET\\_SEGMENT\\_BASE\\_OP](#).

### 17.81.2.2 fiasco\_amd64\_set\_segment\_base()

```

long fiasco_amd64_set_segment_base (
    l4_cap_idx_t thread,
    enum L4_sys_segment sgr,
    l4_umword_t base,
    l4_utcb_t * utcb) [inline]

```

Set the base address for a segment.

### Parameters

<i>thread</i>	Thread for which the base address of the selected segment shall be modified.
---------------	--

<i>segr</i>	Segment to modify (one of <a href="#">L4_sys_segment</a> ).
<i>base</i>	Base address.
<i>utcb</i>	UTCB to be used for this operation, shall be the UTCB of the calling thread. See <a href="#">l4_utcb</a> .

### Return values

<i>L4_EOK</i>	Success.
<i>-L4_EINVAL</i>	Invalid segment ( <i>segr</i> ) or base address ( <i>base</i> ).
<i>-L4_ENOSYS</i>	Operation not supported with current kernel configuration.

Definition at line 32 of file [segment.h](#).

### 17.101.1 Detailed Description

ARM-specific vCPU interface.

Definition in file [\\_\\_vcpu-arch.h](#).

### 17.101.2 Enumeration Type Documentation

#### 17.101.2.1 anonymous enum

anonymous enum

#### Enumerator

<a href="#">L4_VCPU_STATE_VERSION</a>	Architecture-specific version ID. This ID must match the version field in the <a href="#">l4_vcpu_state_t</a> structure after enabling vCPU mode or extended vCPU mode for a thread.
---------------------------------------	--

Definition at line 17 of file [\\_\\_vcpu-arch.h](#).

### 17.101.2.2 L4\_vcpu\_e\_field\_ids

enum `L4_vcpu_e_field_ids`

IDs for extended vCPU state fields.

Bits 14..15: are the field size:

- 0 = 32bit field
- 1 = register width field
- 2 = 64bit field

#### Enumerator

L4_VCPU_E_VTMR_CFG	vtimer irq configuration
--------------------	--------------------------

Definition at line 99 of file `__vcpu-arch.h`.

00022  * Note: The following Assembler statement may produce wrong code:
00023  *   asm volatile ("btsl %1, %2" : "=ccc"(r) : "Jr"(63), "m"(m) : "memory");
00024  *
00025  * The compiler might chose the first variant because the bit number is smaller
00026  * than 64. However, 'bts' is encoded as 32-bit variant ('btsl') and thus only
00027  * supports immediate bit values up to 31. Some assemblers support immediate
00028  * offsets > 31 by adapting the memory address accordingly but GAS does not.
00029  * With GAS, the instruction will encode an immediate value of 63 but the CPU
00030  * will set bit 31 instead of bit 63!
00031  *
00032  * Therefore, if we would use 'btsl' instead of 'btsq', the correct constraint
00033  * for the bit number parameter would be "Ir" instead of "Jr".

## 17.153.1 Function Documentation

### 17.153.1.1 l4io\_get\_root\_device()

```
l4io_device_handle_t l4io_get_root_device (
    void ) [inline]
```

Get root device handle of the device bus.

#### Returns

root device handle

Definition at line 257 of file [io.h](#).

### 17.153.1.2 l4io\_iterate\_devices()

```
int l4io_iterate_devices (
    l4io_device_handle_t * devhandle,
    l4io_device_t * dev,
    l4io_resource_handle_t * reshandle)
```

Iterate over the device bus.

#### Parameters

in, out	<i>devhandle</i>	Device handle to start iterating at. The next device handle is returned here.
out	<i>dev</i>	Device information, may be NULL.
out	<i>reshandle</i>	Resource handle.

#### Returns

0 on success, error code otherwise

References [L4\\_CV](#), and [L4\\_EXPORT](#).

### 17.153.1.3 l4io\_request\_all\_ioports()

```
void l4io_request_all_ioports (
    void(* res_cb )(l4vbus\_resource\_t const *res))
```

Request all available IO-port resources.

#### Parameters

<code>res_cb</code>	Callback function called for every port resource found, give NULL for no callback.
---------------------	--

References [L4\\_CV](#), and [L4\\_EXPORT](#).

#### 17.153.1.4 l4io\_request\_icu()

```
l4_cap_idx_t l4io_request_icu (
    void )
```

Request the ICU object of the client.

#### Returns

Client ICU object, an invalid capability selector is returned if no ICU is available.

References [L4\\_CV](#), and [L4\\_EXPORT](#).

### 17.188.1 Detailed Description

IPC stream.

Definition in file [ipc\\_stream](#).

### 17.188.2 Function Documentation

#### 17.188.2.1 [operator<<\(\)](#) [1/4]

```
L4::lpc::Ostream & operator<< (
    L4::lpc::Ostream &  $s$ ,
    bool  $v$ ) [inline]
```

Insert an element to type  $T$  into the stream  $s$ .

#### Parameters

$s$	The stream to insert the element $v$ .
$v$	The element to insert.

#### Returns

The stream  $s$ .

Definition at line 1197 of file [ipc\\_stream](#).

References [L4::lpc::Ostream::put\(\)](#).

Here is the call graph for this function:

### 17.188.2.2 operator<<() [2/4]

```
L4::Ipc::Ostream & operator<< (  
    L4::Ipc::Ostream & s,  
    char const * v) [inline]
```

Insert a zero terminated character string into the stream *s*.

#### Parameters

<i>s</i>	The stream to insert the string <i>v</i> .
<i>v</i>	The string to insert.

#### Returns

The stream *s*.

This operator produces basically the same content as the array insertion, however the length of the array is calculated using `strlen(v) + 1`. The string is copied into the message including the trailing zero.

Definition at line 1269 of file `ipc_stream`.

References `L4::Ipc::Ostream::put()`.

Here is the call graph for this function:

### 17.188.2.3 operator<<() [3/4]

```
template<typename T>  
L4::Ipc::Ostream & operator<< (  
    L4::Ipc::Ostream & s,  
    L4::Ipc::Internal::Buf_cp_out< T > const & v) [inline]
```

Insert an array with elements of type *T* into the stream *s*.

#### Parameters

<i>s</i>	The stream to insert the array <i>v</i> .
<i>v</i>	The array to insert (see <code>Ipc::Buf_cp_out()</code> ).

**Returns**

The stream *s*.

Definition at line 1248 of file [ipc\\_stream](#).

References [L4::Ipc::Ostream::put\(\)](#).

Here is the call graph for this function:

**17.188.2.4 operator<<() [4/4]**

```

L4::Ipc::Ostream & operator<< (
    L4::Ipc::Ostream & s,
    l4_msgtag_t const & v) [inline]
  
```

Insert the [L4](#) message tag into the stream *s*.

**Parameters**

<i>s</i>	The stream to insert the tag <i>v</i> .
<i>v</i>	The <a href="#">L4</a> message tag to insert.

**Returns**

The stream *s*.

**Note**

Only one message tag can be inserted into a stream. Multiple insertions simply overwrite previous insertions.

Definition at line 1232 of file [ipc\\_stream](#).

References [L4::Ipc::Ostream::tag\(\)](#).

Here is the call graph for this function:

**17.188.2.5 operator>>() [1/6]**

```
L4::Ipc::Istream & operator>> (
    L4::Ipc::Istream & s,
    bool & v) [inline]
```

Extract one element of type T from the stream s.

**Parameters**

	s	The stream to extract from.
out	v	Extracted value.

**Returns**

The stream s.

Definition at line 1044 of file [ipc\\_stream](#).

References [L4::Ipc::Istream::get\(\)](#).

Here is the call graph for this function:

**17.188.2.6 operator>>() [2/6]**

```
template<typename T>
L4::Ipc::Istream & operator>> (
    L4::Ipc::Istream & s,
    L4::Ipc::Internal::Buf_cp_in< T > const & v) [inline]
```

Extract an array of T elements from the stream s.

**Parameters**

	s	The stream to extract from.
out	v	<a href="#">Buffer</a> description to copy the array to ( <a href="#">Ipc::Buf_cp_out()</a> ).

**Returns**

The stream `s`.

This operator does a copy out of the data into the given buffer.

See `lpc::Buf_in`, `lpc::Buf_cp_in`, and `lpc::Buf_cp_out`.

Definition at line 1151 of file `ipc_stream`.

References [L4::lpc::Istream::get\(\)](#).

Here is the call graph for this function:

**17.188.2.7 operator>>() [3/6]**

```

template<typename T>
L4::Ipc::Istream & operator>> (
    L4::Ipc::Istream & s,
    L4::Ipc::Internal::Buf_in< T > const & v) [inline]
  
```

Extract an array of `T` elements from the stream `s`.

**Parameters**

	<code>s</code>	The stream to extract from.
<code>out</code>	<code>v</code>	Pointer to the extracted array ( <code>ipc_buf_in()</code> ).

**Returns**

The stream `s`.

This operator actually does not copy out the data in the array, but returns a pointer into the message buffer itself. This means that the data is only valid as long as there is no new data inserted into the stream.

**Note**

If array does not fit into transmitted words size will be set to zero. Client has to implement check against zero.

See `lpc::Buf_in`, `lpc::Buf_cp_in`, and `lpc::Buf_cp_out`.

Definition at line 1103 of file `ipc_stream`.

References `L4::lpc::Istream::get()`, and `L4::lpc::Istream::has_more()`.

Here is the call graph for this function:

**17.188.2.8 operator>>() [4/6]**

```

template<typename T>
L4::Ipc::Istream & operator>> (
    L4::Ipc::Istream & s,
    L4::Ipc::Msg_ptr< T > const & v) [inline]
  
```

Extract an element of type `T` from the stream `s`.

**Parameters**

	<code>s</code>	The stream to extract from.
<code>out</code>	<code>v</code>	Pointer to the extracted element.

**Returns**

The stream `s`.

This operator actually does not copy out the data, but returns a pointer into the message buffer itself. This means that the data is only valid as long as there is no new data inserted into the stream.

See `Msg_ptr`.

Definition at line 1130 of file `ipc_stream`.

References `L4::lpc::Istream::get()`.

Here is the call graph for this function:

**17.188.2.9 operator>>() [5/6]**

```
template<typename T>
L4::Ipc::Istream & operator>> (
    L4::Ipc::Istream & s,
    L4::Ipc::Str_cp_in< T > const & v) [inline]
```

Extract a zero-terminated string from the stream.

**Parameters**

	<i>s</i>	The stream to extract from.
out	<i>v</i>	Buffer description to copy the array to (lpc::Str_cp_out()).

**Returns**

The stream *s*.

This operator does a copy out of the data into the given buffer.

Definition at line 1172 of file `ipc_stream`.

References `L4::lpc::Istream::get()`.

Here is the call graph for this function:

**17.188.2.10 operator>>() [6/6]**

```
L4::Ipc::Istream & operator>> (
    L4::Ipc::Istream & s,
    l4_msgtag_t & v) [inline]
```

Extract the `L4` message tag from the stream *s*.

**Parameters**

	<i>s</i>	The stream to extract from.
out	<i>v</i>	The extracted tag.

**Returns**

The stream `s`.

Definition at line 1078 of file `ipc_stream`.

References `L4::ipc::lstream::tag()`.

## 17.207 l4/cxx/ref\_ptr\_list File Reference

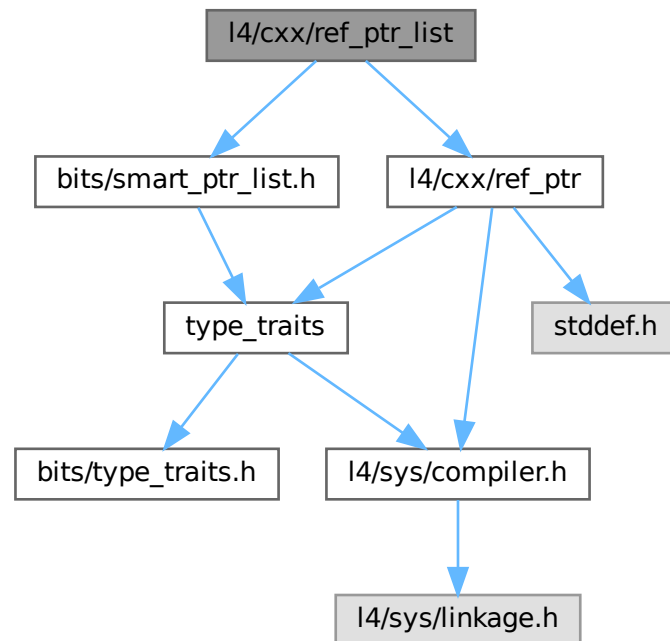

Implementation of a list of ref-ptr-managed objects.

```

#include <l4/cxx/ref_ptr>
#include "bits/smart_ptr_list.h"

```

Include dependency graph for `ref_ptr_list`:

## Data Structures

- struct `cxx::Ref_obj_list_item< T >`  
*Item for list linked via `cxx::Ref_ptr` with default reference counting.*

## Namespaces

- namespace `cxx`  
*Our C++ library.*

## Typedefs

- template<typename T>  
 using `cxx::Ref_ptr_list_item` = `Bits::Smart_ptr_list_item<T, cxx::Ref_ptr<T> >`  
*Item for list linked with `cxx::Ref_ptr`.*
- template<typename T>  
 using `cxx::Ref_ptr_list` = `Bits::Smart_ptr_list<Ref_ptr_list_item<T> >`  
*Single-linked list where elements are connected via a `cxx::Ref_ptr`.*

## 17.207.1 Detailed Description

Implementation of a list of ref-ptr-managed objects.

Definition in file `ref_ptr_list`.

## 17.268 l4/re/c/dma\_space.h File Reference

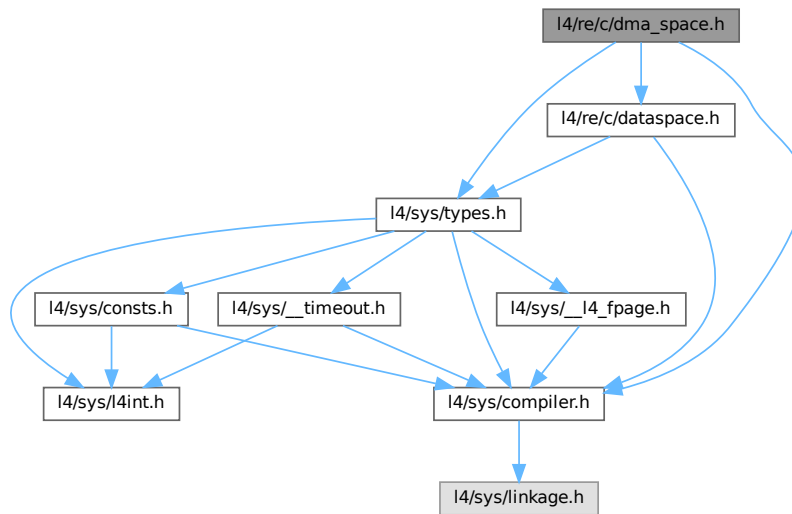

DMA space C interface.

```

#include <l4/sys/compiler.h>
#include <l4/sys/types.h>
#include <l4/re/c/dataspace.h>

```

Include dependency graph for dma\_space.h:

## Typedefs

- typedef [l4\\_cap\\_idx\\_t](#) [l4re\\_dma\\_space\\_t](#)  
DMA space capability type.
- typedef [l4\\_uint64\\_t](#) [l4re\\_dma\\_space\\_dma\\_addr\\_t](#)  
Data type for DMA addresses.

## Enumerations

- enum [l4re\\_dma\\_space\\_direction](#) { [L4RE\\_DMA\\_SPACE\\_BIDIRECTIONAL](#) , [L4RE\\_DMA\\_SPACE\\_TO\\_DEVICE](#) , [L4RE\\_DMA\\_SPACE\\_FROM\\_DEVICE](#) , [L4RE\\_DMA\\_SPACE\\_NONE](#) }  
Direction of the DMA transfers.
- enum [l4re\\_dma\\_space\\_space\\_attrbs](#) { [L4RE\\_DMA\\_SPACE\\_COHERENT](#) = 1 << 0 , [L4RE\\_DMA\\_SPACE\\_PHYS\\_SPACE](#) = 1 << 1 }  
Attributes assigned to the DMA space when associated with a specific device.

## Functions

- long [l4re\\_dma\\_space\\_map](#) ([l4re\\_dma\\_space\\_t](#) dma, [l4re\\_ds\\_t](#) src, [l4re\\_ds\\_offset\\_t](#) offset, [l4\\_size\\_t](#) \*size, unsigned long attr, enum [l4re\\_dma\\_space\\_direction](#) dir, [l4re\\_dma\\_space\\_dma\\_addr\\_t](#) \*dma\_addr) [L4\\_NOTHROW](#)  
Map the given part of this data space into the DMA address space.
- long [l4re\\_dma\\_space\\_unmap](#) ([l4re\\_dma\\_space\\_t](#) dma, [l4re\\_dma\\_space\\_dma\\_addr\\_t](#) dma\_addr, [l4\\_size\\_t](#) size, unsigned long attr, enum [l4re\\_dma\\_space\\_direction](#) dir) [L4\\_NOTHROW](#)  
Unmap the given part of this data space from the DMA address space.
- long [l4re\\_dma\\_space\\_associate](#) ([l4re\\_dma\\_space\\_t](#) dma, [l4\\_cap\\_idx\\_t](#) dma\_task, unsigned long attr) [L4\\_NOTHROW](#)  
Associate a (kernel) DMA space for a device to this Dma\_space.
- long [l4re\\_dma\\_space\\_disassociate](#) ([l4re\\_dma\\_space\\_t](#) dma)  
Disassociate the (kernel) DMA space from this Dma\_space.

### 17.268.1 Detailed Description

DMA space C interface.

Definition in file [dma\\_space.h](#).

### 17.268.2 Enumeration Type Documentation

#### 17.268.2.1 l4re\_dma\_space\_direction

enum [l4re\\_dma\\_space\\_direction](#)

Direction of the DMA transfers.

##### Enumerator

L4RE_DMA_SPACE_BIDIRECTIONAL	device reads and writes to the memory
L4RE_DMA_SPACE_TO_DEVICE	device reads the memory
L4RE_DMA_SPACE_FROM_DEVICE	device writes to the memory
L4RE_DMA_SPACE_NONE	device is coherently connected

Definition at line 27 of file [dma\\_space.h](#).

#### 17.268.2.2 l4re\_dma\_space\_space\_attrbs

enum [l4re\\_dma\\_space\\_space\\_attrbs](#)

Attributes assigned to the DMA space when associated with a specific device.

##### See also

[Space\\_attrbs](#)

##### Enumerator

L4RE_DMA_SPACE_COHERENT	The device is connected coherently with the cache. This means that the <code>map()</code> and <code>unmap()</code> do not need to sync CPU caches before and after DMA.
L4RE_DMA_SPACE_PHYS_SPACE	The DMA space has no DMA task assigned and uses the CPUs physical memory.

Definition at line 38 of file [dma\\_space.h](#).

## 17.275.1 Detailed Description

Inhibitor C interface.

Definition in file [inhibitor.h](#).

## 17.275.2 Function Documentation

### 17.275.2.1 l4re\_inhibitor\_acquire()

```
L4\_BEGIN\_DECLS long l4re_inhibitor_acquire (
    l4\_cap\_idx\_t cap,
    l4\_umword\_t id,
    char const * reason)
```

Acquire an inhibitor lock.

#### Parameters

<i>cap</i>	Capability for the Inhibitor object (see <a href="#">L4Re::Inhibitor</a> )
<i>id</i>	ID of the inhibitor lock that shall be acquired.
<i>reason</i>	Reason why the inhibitor lock is acquired. (Used for informing the user or debugging.)

#### Returns

0 for success, <0 on error.

#### See also

[L4Re::Inhibitor::acquire\(\)](#).

References [L4\\_CV](#), and [L4\\_EXPORT](#).

### 17.275.2.2 l4re\_inhibitor\_next\_lock\_info()

```
long l4re_inhibitor_next_lock_info (
    l4\_cap\_idx\_t cap,
    char * name,
    unsigned len,
    l4\_mword\_t current_id)
```

Get information for the next available inhibitor lock.

#### Parameters

<i>cap</i>	Capability to the Inhibitor object (see <a href="#">L4Re::Inhibitor</a> )
<i>name</i>	A pointer to a buffer for the name of the lock.
<i>len</i>	The length of the available buffer (usually <a href="#">L4Re::Inhibitor::Name_max</a> is used).
<i>current↔ _id</i>	The ID of the last available lock, use -1 to get the first lock.

### Return values

<i>&gt;0</i>	The ID of the next available lock if there is one (in this case name shall contain the name of the inhibitor lock).
<i>-L4_ENODEV</i>	if there are no more locks.
<i>&lt;0</i>	Any other negative failure value.

### See also

### 17.275.2.3 l4re\_inhibitor\_release()

```
long l4re_inhibitor_release (
    l4_cap_idx_t cap,
    l4_umword_t id)
```

Release an inhibitor lock.

### Parameters

<i>cap</i>	Capability for the Inhibitor object (see <a href="#">L4Re::Inhibitor</a> ).
<i>id</i>	ID of inhibitor that shall be released.

### Returns

0 for success, <0 on error.

## 17.277 l4/re/c/log.h File Reference

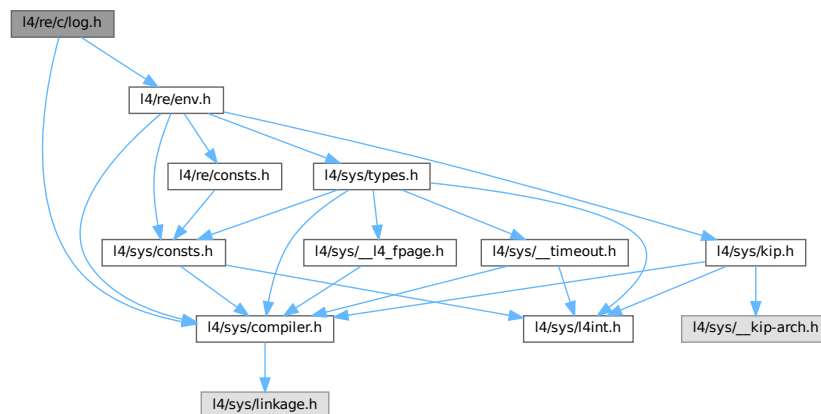

Log C interface.

```

#include <l4/re/env.h>
#include <l4/sys/compiler.h>

```

Include dependency graph for log.h:

### Functions

- **L4\_BEGIN\_DECLS** void **l4re\_log\_print** (char const \*string) **L4\_NOTHROW**  
Write a null terminated string to the default log.
- void **l4re\_log\_printn** (char const \*string, int len) **L4\_NOTHROW**  
Write a string of a given length to the default log.

- void `l4re_log_print_srv` (const `l4_cap_idx_t` logcap, char const \*string) `L4_NOTHROW`  
Write a null terminated string to a log.
- void `l4re_log_printn_srv` (const `l4_cap_idx_t` logcap, char const \*string, int len) `L4_NOTHROW`  
Write a string of a given length to a log.

#include <l4/sys/linkage.h>
Include dependency graph for kumem_alloc.h:

```

### Functions

- `L4_BEGIN_DECLS` `int l4re_util_kumem_alloc (l4_addr_t *mem, unsigned pages_order, l4_cap_idx_t task, l4_cap_idx_t rm) L4_NOTHROW`  
Allocate state area.

### 17.289.1 Detailed Description

Kumem allocator utility C interface.

Definition in file `kumem_alloc.h`.

## 17.289.2 Function Documentation

### 17.289.2.1 l4re\_util\_kumem\_alloc()

```
L4_BEGIN_DECLS int l4re_util_kumem_alloc (
    l4_addr_t * mem,
    unsigned pages_order,
    l4_cap_idx_t task,
    l4_cap_idx_t rm)
```

Allocate state area.

#### Parameters

out	<i>mem</i>	Pointer to memory that has been allocated.
	<i>pages_order</i>	Size to allocate, in log2 pages.
	<i>task</i>	Task to use for allocation.
	<i>rm</i>	Region manager to use for allocation.

#### Return values

0	for success
<0	error code on failure

#### Note

The amount of kernel-user memory that can be allocated at once is limited by the used kernel implementation. The minimum allocatable amount is one page. A portable implementation should not depend on allocations greater than 16KiB to succeed.

#### Examples

[examples/sys/aliens/main.c](#), and [examples/sys/utcb-ipc/main.c](#).

References [L4\\_END\\_DECLS](#), and [L4\\_NOTHROW](#).

## 17.307 l4/re/elf\_aux.h File Reference

Auxiliary information for binaries.

```
#include <l4/sys/types.h>
Include dependency graph for elf_aux.h:
```

### Data Structures

- struct `l4re_elf_aux_t`  
Generic header for each auxiliary vector element.
- struct `l4re_elf_aux_vma_t`  
Auxiliary vector element for a reserved virtual memory area.
- struct `l4re_elf_aux_mword_t`  
Auxiliary vector element for a single unsigned data word.

### Macros

- #define `L4RE_ELF_AUX_ELEM` `const __attribute__((used, section(".ro.l4re_elf_aux"), aligned(sizeof(l4_umword_t))))`  
Define an auxiliary vector element.
- #define `L4RE_ELF_AUX_ELEM_T` `(type, id, tag, val...)`  
Define an auxiliary vector element.

### Typedefs

- typedef struct `l4re_elf_aux_t` `l4re_elf_aux_t`  
Generic header for each auxiliary vector element.
- typedef struct `l4re_elf_aux_vma_t` `l4re_elf_aux_vma_t`  
Auxiliary vector element for a reserved virtual memory area.
- typedef struct `l4re_elf_aux_mword_t` `l4re_elf_aux_mword_t`  
Auxiliary vector element for a single unsigned data word.

## Enumerations
