## 17.283.2 Typedef Documentation

### 17.283.2.1 [gfxbitmap\\_color\\_pix\\_t](#)

```
typedef unsigned int gfxbitmap\_color\_pix\_t
```

Specific color type.

This color type is specific for a particular framebuffer, it can be use to write pixel on a framebuffer. Use [gfxbitmap\\_convert\\_color](#) to convert from [gfxbitmap\\_color\\_t](#) to [gfxbitmap\\_color\\_pix\\_t](#).

Definition at line 65 of file [bitmap.h](#).

### 17.283.2.2 [gfxbitmap\\_color\\_t](#)

```
typedef unsigned int gfxbitmap\_color\_t
```

Standard color type.

It's a RGB type with 8bits for each channel, regardless of the framebuffer used.

Definition at line 56 of file [bitmap.h](#).

## 17.298.2 Function Documentation

### 17.298.2.1 l4re\_inhibitor\_acquire()

```
L4_BEGIN_DECLS long l4re_inhibitor_acquire (
    l4_cap_idx_t cap,
    l4_umword_t id,
    char const * reason)
```

Acquire an inhibitor lock.

#### Parameters

<i>cap</i>	Capability for the Inhibitor object (see <a href="#">L4Re::Inhibitor</a> )
<i>id</i>	ID of the inhibitor lock that shall be acquired.
<i>reason</i>	Reason why the inhibitor lock is acquired. (Used for informing the user or debugging.)

#### Returns

0 for success, <0 on error.

#### See also

[L4Re::Inhibitor::acquire\(\)](#).

References [L4\\_CV](#), and [L4\\_EXPORT](#).

### 17.298.2.2 l4re\_inhibitor\_next\_lock\_info()

long l4re_inhibitor_next_lock_info (
    l4_cap_idx_t cap,
    char * name,
    unsigned len,
    l4_mword_t current_id)
```

Get information for the next available inhibitor lock.

#### Parameters

<i>cap</i>	Capability to the Inhibitor object (see <a href="#">L4Re::Inhibitor</a> )
<i>name</i>	A pointer to a buffer for the name of the lock.
<i>len</i>	The length of the available buffer (usually <a href="#">L4Re::Inhibitor::Name_max</a> is used).
<i>current↔ _id</i>	The ID of the last available lock, use -1 to get the first lock.

### Return values

<i>&gt;0</i>	The ID of the next available lock if there is one (in this case name shall contain the name of the inhibitor lock).
<i>-L4_ENODEV</i>	if there are no more locks.
<i>&lt;0</i>	Any other negative failure value.

```
long l4re_inhibitor_release (
    l4_cap_idx_t cap,
    l4_umword_t id)
```

Release an inhibitor lock.

### Parameters

<i>cap</i>	Capability for the Inhibitor object (see <a href="#">L4Re::Inhibitor</a> ).
<i>id</i>	ID of inhibitor that shall be released.

### Returns

0 for success, <0 on error.

## Functions

- `L4_BEGIN_DECLS l4_cap_idx_t l4re_util_cap_alloc (void) L4_NOTHROW`  
Get free capability index at capability allocator.
- `void l4re_util_cap_free (l4_cap_idx_t cap) L4_NOTHROW`  
Return capability index to capability allocator.
- `void l4re_util_cap_free_um (l4_cap_idx_t cap) L4_NOTHROW`  
Return capability index to capability allocator, and unmaps the object.

Allocate state area.

### 17.312.1 Detailed Description

Kumem allocator utility C interface.

Definition in file `kumem_alloc.h`.

## 17.312.2 Function Documentation

### 17.312.2.1 l4re\_util\_kumem\_alloc()

```
L4_BEGIN_DECLS int l4re_util_kumem_alloc (
    l4_addr_t * mem,
    unsigned pages_order,
    l4_cap_idx_t task,
    l4_cap_idx_t rm)
```

Allocate state area.

#### Parameters

out	<i>mem</i>	Pointer to memory that has been allocated.
	<i>pages_order</i>	Size to allocate, in log2 pages.
	<i>task</i>	Task to use for allocation.
	<i>rm</i>	Region manager to use for allocation.

#### Return values

0	for success
<0	error code on failure

#### Note

The amount of kernel-user memory that can be allocated at once is limited by the used kernel implementation. The minimum allocatable amount is one page. A portable implementation should not depend on allocations greater than 16KiB to succeed.

## 17.430.1 Function Documentation

### 17.430.1.1 [l4shmc\\_rb\\_attach\\_receiver\(\)](#)

```
void l4shmc_rb_attach_receiver (
    l4shmc\_ringbuf\_t * buf,
    l4\_cap\_idx\_t owner)
```

Attach to receiver signal of a ring buffer.

Attach owner to the receiver-side signal of a ring buffer, which is triggered whenever new data has been produced.

This is split from initialization, because you may not know the owner cap when initializing the buffer.

#### Parameters

<i>buf</i>	pointer to ring buffer struct
<i>owner</i>	owner thread

References [L4\\_CV](#).

### 17.430.1.2 [l4shmc\\_rb\\_attach\\_sender\(\)](#)

```
int l4shmc_rb_attach_sender (
    l4shmc\_ringbuf\_t * buf,
    char const * signal_name,
    l4\_cap\_idx\_t owner)
```

Attach to sender signal of a ring buffer.

Attach owner to the sender-side signal of a ring buffer, which is triggered whenever new space has been freed in the buffer for the sender to write to.

This is split from initialization, because you may not know the owner cap when initializing the buffer.

#### Parameters

<i>buf</i>	pointer to ring buffer struct
<i>signal_name</i>	signal base name
<i>owner</i>	owner thread

#### Returns

0 on success, error otherwise

References [L4\\_CV](#).

#### 17.430.1.3 l4shmc\_rb\_deinit\_buffer()

```
void l4shmc_rb_deinit_buffer (  
    l4shmc_ringbuf_t * buf)
```

De-init a ring buffer.

#### Parameters

<i>buf</i>	pointer to ring buffer struct
------------	-------------------------------

References [L4\\_CV](#).

#### 17.430.1.4 l4shmc\_rb\_init\_buffer()

```
int l4shmc_rb_init_buffer (  
    l4shmc_ringbuf_t * buf,  
    l4shmc_area_t * area,  
    char const * chunk_name,  
    char const * signal_name,  
    unsigned size)
```

Initialize a ring buffer by creating an SHMC chunk and the corresponding signals.

This needs to be done by one of the participating parties when setting up communication channel.

#### Precondition

area has been attached using [l4shmc\\_attach\(\)](#).

#### Parameters

<i>buf</i>	pointer to ring buffer struct
<i>area</i>	pointer to SHMC area
<i>chunk_name</i>	name of SHMC chunk to create in area

<i>signal_name</i>	base name for SHMC signals to create
<i>size</i>	chunk size

**Returns**

0 on success, error otherwise

References [L4\\_CV](#).

**17.430.1.5 l4shmc\_rb\_init\_receiver()**

```
int l4shmc_rb_init_receiver (  
    l4shmc_ringbuf_t * buf,  
    l4shmc_area_t * area,  
    char const * chunk_name,  
    char const * signal_name)
```

Initialize receive buffer.

Initialize the receiver-side of a ring buffer. This requires the underlying SHMC chunk and the corresponding signals to be valid already (read: to be initialized by the sender).

**Precondition**

chunk & signals have been created and initialized by the sender side

**Parameters**

<i>buf</i>	pointer to ring buffer struct
<i>area</i>	pointer to SHMC area
<i>chunk_name</i>	name of SHMC chunk to create in area
<i>signal_name</i>	base name for SHMC signals to create

**Returns**

0 on success, error otherwise

References [L4\\_CV](#).

**17.430.1.6 l4shmc\_rb\_receiver\_copy\_out()**

```
int l4shmc_rb_receiver_copy_out (  
    l4shmc_ringbuf_head_t * head,  
    char * target,  
    unsigned * tsize)
```

Copy data out of the buffer.

**Parameters**

	<i>head</i>	ring buffer head pointer
	<i>target</i>	valid target buffer
<i>in, out</i>	<i>size</i>	size of target buffer (must be $\geq$ packet size!); contains the real data size

**Returns**

0 on success, negative error otherwise

References [L4\\_CV](#).

**17.430.1.7 l4shmc\_rb\_receiver\_notify\_done()**

```
void l4shmc_rb_receiver_notify_done (
    l4shmc_ringbuf_t * buf)
```

Notify producer that space is available.

**Parameters**

<i>buf</i>	pointer to ring buffer struct
------------	-------------------------------

References [L4\\_CV](#).

**17.430.1.8 l4shmc\_rb\_receiver\_read\_next\_size()**

```
int l4shmc_rb_receiver_read_next_size (
    l4shmc_ringbuf_head_t * head)
```

Have a look at the ring buffer and see which size the next packet to be read has.

Does not modify anything.

**Returns**

size of next buffer or -1 if no data available

References [L4\\_CV](#), and [L4\\_END\\_DECLS](#).

**17.430.1.9 l4shmc\_rb\_receiver\_wait\_for\_data()**

```
int l4shmc_rb_receiver_wait_for_data (
    l4shmc_ringbuf_t * buf,
    int blocking)
```

Check if (and optionally block until) new data is ready.

**Parameters**

<i>buf</i>	pointer to ring buffer struct
<i>blocking</i>	block if data is not available immediately

Returns immediately, if data is available.

#### Returns

0 success, data available, != 0 otherwise

References [L4\\_CV](#).

#### 17.430.1.10 l4shmc\_rb\_sender\_alloc\_packet()

```
char * l4shmc_rb_sender_alloc_packet (
    l4shmc_ringbuf_head_t * head,
    unsigned psize)
```

Allocate a packet of a given size within the ring buffer.

This packet may wrap around at the end of the buffer. Users need to be aware of that.

#### Parameters

<i>head</i>	ring buffer head pointer
<i>psize</i>	packet size

#### Returns

valid address on success

#### Return values

<i>NULL</i>	if not enough space available
-------------	-------------------------------

References [L4\\_CV](#).

#### 17.430.1.11 l4shmc\_rb\_sender\_commit\_packet()

```
void l4shmc_rb_sender_commit_packet (
    l4shmc_ringbuf_t * buf)
```

Tell the consumer that new data is available.

#### Parameters

---

<i>buf</i>	pointer to ring buffer struct
------------	-------------------------------

References [L4\\_CV](#).

#### 17.430.1.12 l4shmc\_rb\_sender\_next\_copy\_in()

```
int l4shmc_rb_sender_next_copy_in (  
    l4shmc_ringbuf_t * buf,  
    char * data,  
    unsigned size,  
    int block_if_necessary)
```

Copy in packet from an external data source.

This is the function you'll want to use. Just pass it a buffer pointer and let the lib do the work.

##### Parameters

<i>buf</i>	pointer to ring buffer struct
<i>data</i>	valid buffer
<i>size</i>	data size
<i>block_if_necessary</i>	bool: block if buffer currently full

##### Return values

<i>0</i>	on success
<i>-L4_ENOMEM</i>	if block == false and no space available

References [L4\\_CV](#).

#### 17.430.1.13 l4shmc\_rb\_sender\_put\_data()

```
void l4shmc_rb_sender_put_data (  
    l4shmc_ringbuf_t * buf,  
    char * addr,  
    char * data,  
    unsigned dsize)
```

Copy data into a previously allocated packet.

This function is wrap-around aware.

##### Parameters

<i>buf</i>	pointer to ring buffer struct
------------	-------------------------------

<i>addr</i>	valid destination (allocate with <code>alloc_packet()</code> )
<i>data</i>	data source
<i>dsize</i>	data size

References [L4\\_CV](#).

C interface for calling the ARM secure monitor, see [L4::Arm\\_smccc::call\(\)](#) for the C++ interface.

## Parameters

	<i>pfc</i>	Capability of the SMC kernel object. The input parameters consist of a function identifier, 6 arguments and a client id. Results are returned in 4 output parameters.
	<i>func</i>	Function identifier. <ul style="list-style-type: none"> <li>• Bit 31 has to be set: This marks the call as <i>Fast Call</i>. <i>Yielding Calls</i> (bit 31 unset) are rejected by the kernel.</li> <li>• Bit 30 defines the calling convention:</li> <li>• Bit 30 == 1: 64-bit calling convention.</li> <li>• Bit 30 == 0: 32-bit calling convention.</li> <li>• Bits 24..29 determine the service call ID. The permitted IDs are set in the kernel configuration. By default only service IDs &gt;= 0x30000000 (<i>Trusted Application Calls</i> and <i>Trusted OS Calls</i>) are allowed.</li> </ul>

in	<i>in0</i>	First input parameter.
in	<i>in1</i>	Second input parameter.
in	<i>in2</i>	Third input parameter.
in	<i>in3</i>	Fourth input parameter.
in	<i>in4</i>	Fifth input parameter.
in	<i>in5</i>	Sixth input parameter.
out	<i>out0</i>	First output parameter.
out	<i>out1</i>	Second output parameter.
out	<i>out2</i>	Third output parameter.
out	<i>out3</i>	Fourth output parameter.
in	<i>client_id</i>	Client ID. According to the specification, this value might be ignored by certain functions.

### Return values

<code>-L4_ENOSYS</code>	Either bit 31 of the function call not set or service ID outside the range permitted by kernel configuration.
<code>-L4_EINVAL</code>	Invalid number of parameters.
<code>&lt; 0</code>	Other <a href="#">L4</a> error.
<code>0</code>	Success.

#### 17.464.2.1 L4\_DISABLE\_COPY

```
#define L4_DISABLE_COPY(  
    _class)
```

#### Value:

```
public:
    _class(_class const &) = delete; \
    _class operator = (_class const &) = delete; \
private:
```

Disable copy of a class.

#### Parameters

<code>_class</code>	Name of the class that shall not have value copy semantics.
---------------------	-------------------------------------------------------------

The typical use of this is:

```
class Non_value
{
    L4_DISABLE_COPY(Non_value)

    ...
}

### 17.474.2 Enumeration Type Documentation

#### 17.474.2.1 anonymous enum

anonymous enum

Defaults for local thread priorities.

Priorities are to be seen as local. These are used by the loader and libpthread. They are to be understood as 'local', which means the actual priority of the thread (as seen by the kernel) is the base priority as defined by the scheduler plus the local priority.

## 17.486.1 Macro Definition Documentation

### 17.486.1.1 L4\_RPC\_DEF

```
#define L4_RPC_DEF (
    name)
```

#### Value:

```
template struct L4::Ipcc::Msg::Rpc_call \
    <name##_t, name##_t::class_type, name##_t::ipc_type, name##_t::flags_type>
```

Generate the definition of an RPC stub.

#### Parameters

<i>name</i>	The fully qualified method name to be implemented, this means <code>class::method</code> .
-------------	--------------------------------------------------------------------------------------------

This macro generates the definition (implementation) for the given RPC interface method.

Definition at line 32 of file [ipc\\_client](#).

## 17.489.2 Macro Definition Documentation

### 17.489.2.1 L4\_INLINE\_RPC

```
#define L4_INLINE_RPC(
    res,
    name,
    args,
    attr...)
```

#### Value:

`res name args`

Define an inline RPC call (type and callable).

#### Parameters

<i>res</i>	The result type of the RPC call
<i>name</i>	The name of the function ( <code>name_t</code> is used for the type.)
<i>args</i>	The argument list of the RPC function.
<i>attr</i>	Optional RPC attributes ( <a href="#">L4::lpc::Call</a> , <a href="#">L4::lpc::Call_t</a> etc.).

#### Examples

[examples/clntsrv/src/shared.h](#).

Definition at line 482 of file [ipc\\_iface](#).

### 17.489.2.2 L4\_INLINE\_RPC\_NF

```
#define L4_INLINE_RPC_NF(
    res,
    name,
    args...)
```

#### Value:

```
struct name##_t : L4::Ipc::Msg::Rpc_inline_call<name##_t, Class, res args> \
{ \
    typedef L4::Ipc::Msg::Rpc_inline_call<name##_t, Class, res args> type; \
    L4_INLINE_RPC_SRV_FORWARD(name); \
}
```

Define an inline RPC call type (the type only, no callable).

#### Parameters

<i>res</i>	The result type of the RPC call
<i>name</i>	The name of the function ( <code>name_t</code> is used for the type.)
<i>args</i>	The argument list of the RPC function, and RPC attributes ( <a href="#">L4::lpc::Call</a> , <a href="#">L4::lpc::Call_t</a> etc.).

Stubs generated by this macro can be used explicitly in custom wrapper methods that need to use the underlying RPC code and provide some higher level abstraction, for example with default arguments or extra argument conversion.

### 17.503.1 Macro Definition Documentation

#### 17.503.1.1 L4\_TYPES\_FLAGS\_OPS\_DEF

```
#define L4_TYPES_FLAGS_OPS_DEF(  
    T)
```

#### Value:

```
friend constexpr T operator ~ (T f)
{
    return T(~static_cast<typename L4::Types::Int_for_type<T>::type>(f));
}

friend constexpr T operator | (T l, T r)
{
    return T(static_cast<typename L4::Types::Int_for_type<T>::type>(l)
        | static_cast<typename L4::Types::Int_for_type<T>::type>(r));
}

friend constexpr T operator & (T l, T r)
{
    return T(static_cast<typename L4::Types::Int_for_type<T>::type>(l)
        & static_cast<typename L4::Types::Int_for_type<T>::type>(r));
}
```

Helper macro to define a set of bitwise operators on an enum type.

This allows to use the enum type as bitmask type with '&', '|', and '~' operators that keep the enum type as result.

### 17.531.1 Detailed Description

The C IPC gate interface, see [L4::ipc\\_gate](#) for the C++ interface.

IPC gates are used to create secure communication channels between protection domains. An IPC gate can be created using the [Factory](#) interface.

Depending on the permissions of the capability used, an IPC gate forwards IPC to the [Thread](#) the IPC gate is *bound* to (cf. [l4\\_rcv\\_ep\\_bind\\_thread\(\)](#) and [l4\\_rcv\\_ep\\_bind\\_snd\\_destination\(\)](#)). If the capability has the [L4\\_FPAGE\\_C\\_IPCGATE\\_SVR](#) permission, only IPC using a protocol different from the [L4\\_PROTO\\_KOBJECT](#) protocol is forwarded. Without the [L4\\_FPAGE\\_C\\_IPCGATE\\_SVR](#) permission, all IPC is forwarded. The latter is the usual case for a client in a client/server scenario. When not bound to a thread or thread group yet, the forwarded IPC blocks until the IPC gate is bound to a thread or thread group, or the IPC times out.

Forwarded IPC is always forwarded to the userland of the thread the IPC gate is bound to, either directly or indirectly using a thread group. That means, the [Thread](#) interface of that thread is not accessible via an IPC gate. The [IPC-Gate API](#) of an IPC gate is only accessible if the capability used has the [L4\\_FPAGE\\_C\\_IPCGATE\\_SVR](#) permission (cf. previous paragraph). Conversely that means, if the capability used lacks the [L4\\_FPAGE\\_C\\_IPCGATE\\_SVR](#) permission, [IPC-Gate API](#) calls are forwarded to the thread or thread group the IPC gate is bound to instead of being processed by the IPC gate itself. In a client/server scenario, a client should only get IPC gate capabilities without [L4\\_FPAGE\\_C\\_IPCGATE\\_SVR](#) permission so the client cannot tamper with the IPC gate.

When binding an IPC gate to a thread or thread group, a user-defined, kernel protected, machine-word sized payload called the IPC gate's *label* is assigned to the IPC gate (note that the two least significant bits of the label must be zero; cf. [l4\\_rcv\\_ep\\_bind\\_thread\(\)](#) and [l4\\_rcv\\_ep\\_bind\\_snd\\_destination\(\)](#)). When a send-only IPC or call IPC is forwarded via an IPC gate, the label provided by the sender is ignored and replaced by the IPC gate's label where the two least significant bits are set to the [L4\\_CAP\\_FPAGE\\_S](#) and [L4\\_CAP\\_FPAGE\\_W](#) permissions of the capability used. The replaced label is only visible to the thread the IPC gate is bound to upon receive (or to the selected thread from the thread group the IPC gate is bound to). However, the configured label of an IPC gate can also be queried via [l4\\_ipc\\_gate\\_get\\_infos\(\)](#) if the capability used has the [L4\\_FPAGE\\_C\\_IPCGATE\\_SVR](#) permission.

When deleting an IPC gate or when unbinding it from a thread or thread group, the label of IPC already in flight won't be changed. To ensure that no IPC from this IPC gate is received by a thread with an unexpected label, [l4\\_thread\\_modify\\_sender\\_start\(\)](#) shall be used to change the labels of every pending IPC to that gate. This is also required if the label of an already bound IPC gate is changed. It is not necessary after binding the IPC gate to a thread or thread group for the first time.

When binding a currently bound IPC gate to a new thread or thread group, the same label should be used that was used with the old thread. Otherwise the old and the new thread need to synchronize to avoid IPC messages with unexpected labels.

Include dependency graph for irq:
```

The diagram is a complex network graph with numerous nodes and edges. The nodes are represented by rectangular boxes, many of which contain text labels. The edges are blue lines connecting the nodes, forming a dense web of relationships. The network is organized into several clusters or communities, with some nodes acting as central hubs. The labels on the nodes include names of individuals (e.g., "John Doe", "Jane Smith"), organizations (e.g., "ABC Company", "XYZ Corporation"), and locations (e.g., "New York City", "Los Angeles"). The overall structure suggests a highly interconnected system, possibly representing a social network, a corporate hierarchy, or a geographical network.

    l4\_umword\_t * result_all) [inline]
```

Retrieve information from the kernel about all objects in the mapping database and write data to the passed KU memory.

#### Parameters

	<i>cap</i>	Capability of the debugger object.
	<i>ku_mem_addr</i>	Address of the KU memory for writing the information.
	<i>ku_mem_size</i>	Size of the KU memory to writing the information.
	<i>skip</i>	Number of objects to skip.
out	<i>result_cnt</i>	Number of objects in the mapping database.
out	<i>result_all</i>	Number of objects written to the KU memory.

**Note**

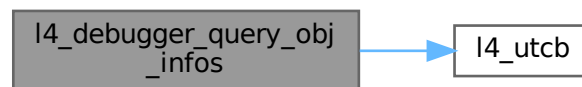

The kernel will only write a number of object information which fits to the passed KU memory. To retrieve missing object information, repeat the call and adapt the `skip` parameter accordingly.

If this system call is performed several times, the number of kernel objects might have changed in the meantime.

### 17.624.2.1 l4\_assert

```
#define l4_assert(  
    expr)
```

#### Value:

```
l4_assert_fn(!(expr), __FILE__ ":" L4_stringify(__LINE__) ": Assertion \"" \
    L4_stringify(expr) "\" failed.\n")
```

Low-level assert.

#### Parameters

<i>expr</i>	Expression to be evaluate for the assertion.
-------------	----------------------------------------------

This assertion is a low-level implementation that directly uses kernel primitives. Only use [l4\\_assert\(\)](#) when the standard `assert()` functionality is not available.

### 17.645.2.1 l4\_kip\_for\_each\_feature

```
#define l4_kip_for_each_feature(

```

**Value:**

```
for (s += __builtin_strlen(s) + 1; *s; s += __builtin_strlen(s) + 1)
```

Cycle through kernel features given in the KIP.

Cycles through all KIP kernel feature strings. *s* must be a character pointer (`char const *`) initialized with [l4\\_kip\\_version\\_string\(\)](#).

```
int l4_kip_kernel_has_feature (  
    l4_kernel_info_t const * kip,  
    char const * str) [inline]
```

Check if kernel supports a feature.

**Parameters**

<i>kip</i>	Pointer to the kernel info page (KIP).
<i>str</i>	Feature name to check.

**Returns**

1 if the kernel supports the feature, 0 if not.

Checks the feature field in the KIP for the given string.

### 17.657.2 Macro Definition Documentation

#### 17.657.2.1 l4util\_mb\_for\_each\_mmap\_entry

```
#define l4util_mb_for_each_mmap_entry(  
    i,  
    mbi)
```

**Value:**

```
for (i = l4util_mb_first_mmap_entry(mbi);  
     (unsigned long)i < (unsigned long)mbi->mmap_addr + mbi->mmap_length;  
     i = l4util_mb_next_mmap_entry(i))
```

Iterate over a memory map provided in a Multiboot info.

#### Parameters

<i>i</i>	Name of a variable of type <a href="#">l4util_mb_addr_range_t</a> * that is consecutively assigned pointers to the entries of the memory map.
<i>mbi</i>	Pointer to the <a href="#">l4util_mb_info_t</a> where the memory map can be found.

#### 17.657.2.2 L4UTIL\_MB\_MEMORY

```
#define L4UTIL_MB_MEMORY 0x00000001
```

Flags to be set in the 'flags' parameter above.

is there basic lower/upper memory information?

#### 17.657.2.3 MB\_ART\_MEMORY

```
#define MB_ART_MEMORY 1
```

void L4_NORETURN name(void)
```

Defines a wrapper function that sets up the registers according to the calling conventions for the architecture.

Use this as a function header when starting a low-level thread where only stack and instruction pointer are in a well-defined state.

Example:

```
L4UTIL_THREAD_FUNC(helper_thread) { l4_infinite_loop(); }
```

```
thread_cap->ex_regs((l4_umword_t)helper_thread, stack_addr);
```

## 17.676.2 Enumeration Type Documentation

### 17.676.2.1 anonymous enum

anonymous enum

Constants for device nodes.

#### Enumerator

L4VBUS_NULL	NULL device.
L4VBUS_ROOT_BUS	Root device on the vbus.

Definition at line 20 of file [vbus.h](#).

### 17.676.2.2 l4vbus\_icu\_src\_types

enum [l4vbus\\_icu\\_src\\_types](#)

Flags that can be used with the ICU on a vbus device.

#### Enumerator

L4VBUS_ICU_SRC_DEV_HANDLE	Flag to denote that the value should be interpreted as a device handle. This flag may be used in the <code>source</code> parameter in <a href="#">l4_icu_msi_info()</a> to denote that the ICU should interpret the source ID as a device handle.

## 17.684.1 Detailed Description

This header contains the definition of VBUS sub-interfaces and convenience functions to work with the interface IDs.

Definition in file [vbus\\_interfaces.h](#).

## 17.684.2 Typedef Documentation

### 17.684.2.1 l4vbus\_iface\_type\_t

```
typedef enum l4vbus_iface_type_t l4vbus_iface_type_t
```

Different sub-interfaces a vbus device may support.

The IPC interface of vbus devices is divided into functional groups of sub-interfaces. Every device must implement the generic interface which provides general device information. According to the type of device, additional functionality may be supported.

The sub-interface constants are first of all used to divide the function opcode space of the interface into these functional groups (see [L4VBUS\\_IFACE\\_SHIFT](#)). They also make up a bitmask that specify the type of the device, i.e. from the point of view of the client a device is defined by the kinds of sub-interfaces it supports.

## 17.684.3 Enumeration Type Documentation

anonymous enum

#### Enumerator

L4VBUS_IFACE_SHIFT	Sub-interface ID shift. Divides the function opcode sent via IPC into a sub-interface ID and the actual function opcode within the sub-interface.

## 17.684.4 Function Documentation

### 17.684.4.1 l4vbus\_subinterface\_supported()

```
int l4vbus_subinterface_supported (
    l4_uint32_t dev_type,
    l4vbus_iface_type_t iface_type) [inline]
```

Check if a vbus device supports a given sub-interface.

#### Parameters

---

<i>dev_type</i>	Device type as reported in <a href="#">l4vbus_device_t</a> .
<i>iface_type</i>	Sub-interface type to check for.

## Returns

True if the device supports the sub-interface.

## 17.692.2 Enumeration Type Documentation

### 17.692.2.1 l4vbus\_device\_flags\_t

enum [l4vbus\\_device\\_flags\\_t](#)

Flags describing device properties, see [l4vbus\\_device\\_t](#).

#### Enumerator

<a href="#">L4VBUS_DEVICE_F_CHILDREN</a>	Device has child devices.
------------------------------------------	---------------------------

Definition at line 92 of file [vbus\\_types.h](#).

### 17.692.2.2 l4vbus\_resource\_flags\_t

enum [l4vbus\\_resource\\_flags\\_t](#)

Description of vbus resource flags.

#### Enumerator

<a href="#">L4VBUS_RESOURCE_F_MEM_R</a>	Memory resource is readable.
-----------------------------------------	------------------------------

L4VBUS_RESOURCE_F_MEM_W	Memory resource is writeable.
L4VBUS_RESOURCE_F_MEM_PREFETCHABLE	Memory resource is prefetchable. Clients may map it buffered or non-cached.
L4VBUS_RESOURCE_F_MEM_CACHEABLE	Memory resource is cacheable. This implies that the memory resource is prefetchable. If not set, clients must not map it cached. If the resource is neither cacheable nor prefetchable, clients must map it non-cached!
L4VBUS_RESOURCE_F_MEM_MMIO_READ	Reading needs to be performed using the MMIO space protocol.
L4VBUS_RESOURCE_F_MEM_MMIO_WRITE	Writing needs to be performed using the MMIO space protocol.

Definition at line 51 of file [vbus\\_types.h](#).

### 17.692.2.3 l4vbus\_resource\_type\_t

enum [l4vbus\\_resource\\_type\\_t](#)

Description of vbus resource types.

#### Enumerator

L4VBUS_RESOURCE_INVALID	Invalid type.
L4VBUS_RESOURCE_IRQ	Interrupt resource.
L4VBUS_RESOURCE_MEM	I/O memory resource.
L4VBUS_RESOURCE_PORT	I/O port resource (x86 only).
L4VBUS_RESOURCE_BUS	Bus resource.
L4VBUS_RESOURCE_GPIO	Gpio resource.
L4VBUS_RESOURCE_DMA_DOMAIN	DMA domain.

### 17.697.2.1 l4\_vcpu\_check\_version()

```
int l4_vcpu_check_version (  
    l4_vcpu_state_t const * vcpu) [inline]
```

Check if a vCPU state has the right version.

#### Parameters

---

<code>vcpu</code>	A pointer to an initialized vCPU state.
-------------------	-----------------------------------------

### Return values

1	If the vCPU state has a matching version ID for the current vCPU user-level structures.
0	If the vCPU state has a different (incompatible) version ID than the current vCPU user-level structures.
